This RFC specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo describes an extension to the message format defined in RFC 1521 [1], to allow the representation of character sets other than ASCII in RFC 822 (STD 11) message headers. The extensions described were designed to be highly compatible with existing Internet mail handling software, and to be easily implemented in mail readers that support RFC 1521.

1. Introduction

RFC 1521 describes a mechanism for denoting textual body parts which are coded in various character sets, as well as methods for encoding such body parts as sequences of printable ASCII characters. This memo describes similar techniques to allow the encoding of non-ASCII text in various portions of a RFC 822 [2] message header, in a manner which is unlikely to confuse existing message handling software.

Like the encoding techniques described in RFC 1521, the techniques outlined here were designed to allow the use of non-ASCII characters in message headers in a way which is unlikely to be disturbed by the quirks of existing Internet mail handling programs. In particular, some mail relaying programs are known to (a) delete some message header fields while retaining others, (b) rearrange the order of addresses in To or Cc fields, (c) rearrange the (vertical) order of header fields, and/or (d) "wrap" message headers at different places than those in the original message. In addition, some mail reading programs are known to have difficulty correctly parsing message headers which, while legal according to RFC 822, make use of backslash-quoting to "hide" special characters such as "<", ",", or ":", or which exploit other infrequently-used features of that

specification.

While it is unfortunate that these programs do not correctly interpret RFC 822 headers, to "break" these programs would cause severe operational problems for the Internet mail system. The extensions described in this memo therefore do not rely on little-used features of RFC 822.

Instead, certain sequences of "ordinary" printable ASCII characters (known as "encoded-words") are reserved for use as encoded data. The syntax of encoded-words is such that they are unlikely to "accidentally" appear as normal text in message headers. Furthermore, the characters used in encoded-words are restricted to those which do not have special meanings in the context in which the encoded-word appears.

Generally, an "encoded-word" is a sequence of printable ASCII characters that begins with "=?", ends with "?=", and has two "?"s in between. It specifies a character set and an encoding method, and also includes the original text encoded as graphic ASCII characters, according to the rules for that encoding method.

A mail composer that implements this specification will provide a means of inputting non-ASCII text in header fields, but will translate these fields (or appropriate portions of these fields) into encoded-words before inserting them into the message header.

A mail reader that implements this specification will recognize encoded-words when they appear in certain portions of the message header. Instead of displaying the encoded-word "as is", it will reverse the encoding and display the original text in the designated character set.

NOTES

This memo relies heavily on notation and terms defined STD 11, RFC 822 and RFC 1521. In particular, the syntax for the ABNF used in this memo is defined in STD 11, RFC 822, as well as many of the terms used in the grammar for the header extensions defined here. Successful implementation of this protocol extension requires careful attention to the details of both STD 11, RFC 822 and RFC 1521.

When the term "ASCII" appears in this memo, it refers to the "7-Bit American Standard Code for Information Interchange", ANSI X3.4-1986. The MIME charset name for this character set is "US-ASCII". When not specifically referring to the MIME charset name, this document uses the term "ASCII", both for brevity and for

consistency with STD 11, RFC 822. However, implementors are warned that the character set name must be spelled "US-ASCII" in MIME message and body part headers.

2. Syntax of encoded-words

An "encoded-word" is defined by the following ABNF grammar. The notation of RFC 822 is used, with the exception that white space characters MAY NOT appear between components of an encoded-word.

```
encoded-word = "=?" charset "?" encoding "?" encoded-text "?="

charset = token ; see section 3

encoding = token ; see section 4

token = 1*<Any CHAR except SPACE, CTLs, and especials>

especials = "(" / ")" / "<" / ">" / "@" / "," / ";" / ":" / "
<"> / "/" / "[" / "]" / "?" / "." / "="

encoded-text = 1*<Any printable ASCII character other
than "?" or SPACE>
; (but see "Use of encoded-words in message
; headers", section 5)
```

Both "encoding" and "charset" names are case-independent. Thus the charset name "ISO-8859-1" is equivalent to "iso-8859-1", and the encoding named "Q" may be spelled either "Q" or "q".

An encoded-word may not be more than 75 characters long, including charset, encoding, encoded-text, and delimiters. If it is desirable to encode more text than will fit in an encoded-word of 75 characters, multiple encoded-words (separated by CRLF SPACE) may be used.

While there is no limit to the length of a multiple-line header field, each line of a header field that contains one or more encoded-words is limited to 76 characters.

The length restrictions are included not only to ease interoperability through internetwork mail gateways, but also to impose a limit on the amount of lookahead a header parser must employ (while looking for a final ?= delimiter) before it can decide whether a token is an encoded-word or something else.

The characters which may appear in encoded-text are further restricted by the rules in section 5.

3. Character sets

The "charset" portion of an encoded-word specifies the character set associated with the unencoded text. A charset can be any of the character set names allowed in an RFC 1521 "charset" parameter of a "text/plain" body part, or any character set name registered with IANA for use with the MIME text/plain content-type [3]. (See section 7.1.1 of RFC 1521 for a list of charsets defined in that document).

Some character sets use code-switching techniques to switch between "ASCII mode" and other modes. If unencoded text in an encoded-word contains control codes to switch out of ASCII mode, it must also contain additional control codes such that ASCII mode is again selected at the end of the encoded-word. (This rule applies separately to each encoded-word, including adjacent encoded-words within a single header field.)

When there is a possibility of using more than one character set to represent the text in an encoded-word, and in the absence of private agreements between sender and recipients of a message, it is recommended that members of the ISO-8859-* series be used in preference to other character sets.

4. Encodings

Initially, the legal values for "encoding" are "Q" and "B". These encodings are described below. The "Q" encoding is recommended for use when most of the characters to be encoded are in the ASCII character set; otherwise, the "B" encoding should be used. Nevertheless, a mail reader which claims to recognize encoded-words MUST be able to accept either encoding for any character set which it supports.

Only a subset of the printable ASCII characters may be used in encoded-text. Space and tab characters are not allowed, so that the beginning and end of an encoded-word are obvious. The "?" character is used within an encoded-word to separate the various portions of the encoded-word from one another, and thus cannot appear in the encoded-text portion. Other characters are also illegal in certain contexts. For example, an encoded-word in a "phrase" preceding an address in a From header field may not contain any of the "specials" defined in RFC 822. Finally, certain other characters are disallowed in some contexts, to ensure reliability for messages that pass through internetwork mail gateways.

The "B" encoding automatically meets these requirements. The "Q" encoding allows a wide range of printable characters to be used in non-critical locations in the message header (e.g., Subject), with

fewer characters available for use in other locations.

4.1. The "B" encoding

The "B" encoding is identical to the "BASE64" encoding defined by RFC 1521.

4.2. The "Q" encoding

The "Q" encoding is similar to the "Quoted-Printable" content-transfer-encoding defined in RFC 1521. It is designed to allow text containing mostly ASCII characters to be decipherable on an ASCII terminal without decoding.

(1) Any 8-bit value may be represented by a "=" followed by two hexadecimal digits. For example, if the character set in use were ISO-8859-1, the "=" character would thus be encoded as "=3D", and a SPACE by "=20". (Upper case should be used for hexadecimal digits "A" through "F".)

(2) The 8-bit hexadecimal value 20 (e.g., ISO-8859-1 SPACE) may be represented as "_" (underscore, ASCII 95.). (This character may not pass through some internetwork mail gateways, but its use will greatly enhance readability of "Q" encoded data with mail readers that do not support this encoding.) Note that the "_" always represents hexadecimal 20, even if the SPACE character occupies a different code position in the character set in use.

(3) 8-bit values which correspond to printable ASCII characters other than "=", "?", "_" (underscore), and SPACE may be represented as those characters. (But see section 5 for restrictions.)

5. Use of encoded-words in message headers

An encoded-word may appear in a message header or body part header according to the following rules:

(1) An encoded-word may replace a "text" token (as defined by RFC 822) in any Subject or Comments header field, any extension message header field, or any RFC 1521 body part field for which the field body is defined as "*text". An encoded-word may also appear in any user-defined ("X-") message or body part header field.

Ordinary ASCII text and encoded-words may appear together in the same header field. However, an encoded-word that appears in a header field defined as "*text" MUST be separated from any adjacent encoded-word or "text" by linear-white-space.

(2) An encoded-word may appear within a comment delimited by "(" and ")", i.e., wherever a "ctext" is allowed. More precisely, the RFC 822 ABNF definition for "comment" is amended as follows:

comment = "(" *(ctext / quoted-pair / comment / encoded-word) ")"

A "Q"-encoded encoded-word which appears in a comment MUST NOT contain the characters "(", ")" or " encoded-word that appears in a "comment" MUST be separated from any adjacent encoded-word or "ctext" by linear-white-space.

(3) As a replacement for a "word" entity within a "phrase", for example, one that precedes an address in a From, To, or Cc header. The ABNF definition for phrase from RFC 822 thus becomes:

phrase = 1*(encoded-word / word)

In this case the set of characters that may be used in a "Q"-encoded encoded-word is restricted to: <upper and lower case ASCII letters, decimal digits, "!", "*", "+", "-", "/", "=", and "_" (underscore, ASCII 95.)>. An encoded-word that appears within a "phrase" MUST be separated from any adjacent "word", "text" or "special" by linear-white-space.

These are the ONLY locations where an encoded-word may appear. In particular, an encoded-word MUST NOT appear in any portion of an "addr-spec". In addition, an encoded-word MUST NOT be used in a Received header field.

Each encoded-word MUST encode an integral number of octets. The encoded-text in each encoded-word must be well-formed according to the encoding specified; the encoded-text may not be continued in the next encoded-word. (For example, "=?charset?Q?=?= =?charset?Q?AB?=" would be illegal, because the two hex digits "AB" must follow the "=" in the same encoded-word.)

Each encoded-word MUST represent an integral number of characters. A multi-octet character may not be split across adjacent encoded-words.

Only printable and white space character data should be encoded using this scheme. However, since these encoding schemes allow the encoding of arbitrary octet values, mail readers that implement this decoding should also ensure that display of the decoded data on the recipient's terminal will not cause unwanted side-effects.

Use of these methods to encode non-textual data (e.g., pictures or sounds) is not defined by this memo. Use of encoded-words to

represent strings of purely ASCII characters is allowed, but discouraged. In rare cases it may be necessary to encode ordinary text that looks like an encoded-word.

6. Support of encoded-words by mail readers

6.1. Recognition of encoded-words in message headers

A mail reader must parse the message and body part headers according to the rules in RFC 822 to correctly recognize encoded-words.

Encoded-words are to be recognized as follows:

(1) Any message or body part header field defined as "*text", or any user-defined header field, should be parsed as follows: Beginning at the start of the field-body and immediately following each occurrence of linear-white-space, each sequence of up to 75 printable characters (not containing any linear-white-space) should be examined to see if it is an encoded-word according to the syntax rules in section 2. Any other sequence of printable characters should be treated as ordinary ASCII text.

(2) Any header field not defined as "*text" should be parsed according to the syntax rules for that header field. However, any "word" that appears within a "phrase" should be treated as an encoded-word if it meets the syntax rules in section 2. Otherwise it should be treated as an ordinary "word".

(3) Within a "comment", any sequence of up to 75 printable characters (not containing linear-white-space), that meets the syntax rules in section 2, should be treated as an encoded-word. Otherwise it should be treated as normal comment text.

6.2. Display of encoded-words

Any encoded-words so recognized are decoded, and if possible, the resulting unencoded text is displayed in the original character set.

When displaying a particular header field that contains multiple encoded-words, any linear-white-space that separates a pair of adjacent encoded-words is ignored. (This is to allow the use of multiple encoded-words to represent long strings of unencoded text, without having to separate encoded-words where spaces occur in the unencoded text.)

In the event other encodings are defined in the future, and the mail reader does not support the encoding used, it may either (a) display the encoded-word as ordinary text, or (b) substitute an appropriate

message indicating that the text could not be decoded.

If the mail reader does not support the character set used, it may (a) display the encoded-word as ordinary text (i.e., as it appears in the header), (b) make a "best effort" to display using such characters as are available, or (c) substitute an appropriate message indicating that the decoded text could not be displayed.

If the character set being used employs code-switching techniques, display of the encoded text implicitly begins in "ASCII mode". In

addition, the mail reader must ensure that the output device is once again in "ASCII mode" after the encoded-word is displayed.

6.3. Mail reader handling of incorrectly formed encoded-words

It is possible that an encoded-word that is legal according to the syntax defined in section 2, is incorrectly formed according to the rules for the encoding being used. For example:

(1) An encoded-word which contains characters which are not legal for a particular encoding (for example, a '-' in the "B" encoding), is incorrectly formed.

(2) Any encoded-word which encodes a non-integral number of characters or octets is incorrectly formed.

A mail reader need not attempt to display the text associated with an encoded-word that is incorrectly formed. However, a mail reader MUST NOT prevent the display or handling of a message because an encoded-word is incorrectly formed.

7. Conformance

A mail composing program claiming compliance with this specification MUST ensure that any string of non-white-space printable ASCII characters within a "*text" or "*ctext" that begins with "=?" and ends with "?=" be a valid encoded-word. ("begins" means: at the start of the field-body or immediately following linear-white-space; "ends" means: at the end of the field-body or immediately preceding linear-white-space.) In addition, any "word" within a "phrase" that begins with "=?" and ends with "?=" must be a valid encoded-word.

A mail reading program claiming compliance with this specification must be able to distinguish encoded-words from "text", "ctext", or "word"s, according to the rules in section 6, anytime they appear in appropriate places in message headers. It must support both the "B" and "Q" encodings for any character set which it supports. The program must be able to display the unencoded text if the character

set is "US-ASCII". For the ISO-8859-* character sets, the mail reading program must at least be able to display the characters which are also in the ASCII set.

4712. Need digital filter design

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-25 00:00:00 UTC
From: rn@cs.brown.edu
Message-ID: <46l7k0$29g@cocoa.brown.edu>
Source record: 40799
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

I am looking for advice on building a digital filter. I have a
real-time 16-bit audio stream, generated by sampling at 16kHz,
that I need to have high-pass filtered to eliminate PL tones.
The filtering is part of a custom repeater controller I'm running
on a Sun Sparcstation 10, so I have plenty of CPU available to run
the filter code. Years ago someone showed me a "recursive" digital
filter which was extremely simple, replacing each audio sample by
a weighting of the previous two samples (the weights determined the
filter cutoff). Unfortunately I don't remember the details. Can
anyone provide help, or at least some references to books or papers?

I need a list of popular 2M packet nodes in the Dallas area for a new ham wanting to come up on packet. If there is a central contact in the area that can help new packet hams, that would also be appreciated.

tnx

: the State of Kentucky, or any agency of any government.
: If you do not like my opinion, just get on with your life.
: I will not change your mind and you damn sure can not change mine."

I bought an MFJ-1278B for my wife to do slowscan and it turned out
to be the most useless piece of equipment that I ever had my hands on.
We ended up taking it back - the people at HRO were very nice about
it and didn't even charge a restocking fee. The interface for fax/sstv
that is part of this box is low-res and just about worthless. The
'Multicom' software that 'supports' it has got to be the worst example
of programming and functionality that I've seen in 15 years of
computer systems administration and PC support. It simply doesn't work
right for slowscan. The converter from pcx to any of the formats produces
grainy, unusable images. The 'auto-start' doesn't. And nobody uses
16 colors or shades of grey on the air. This is typical MFJ
'hyper-marketing' - just check out the wording in their catalogs and

compare it with reality.

On the positive side, the packet and CW modes worked fairly well - but no thanks to 'Multicom'. And the zinger is - why put a stupid copy protection scheme on software that only runs on your box? This hasn't been done even in the 'DOS' world for years.
Oh brother!

>relevant to amateur radio.

Data is data. How can internet be different? Sure they are connected
differently, but everything else is the same.

>In such an environment the store-and-forward message transmission is
>much more optimal than direct delivery.

I agree. UUCP was a success story in the 70's. It was a wonderful system
of mailing files and correspondence. Even it was better than MSYS, FBB.

>>Speaking of Linux on packet, you would think that with the development of
>>AX.25 in the kernel that people would want to run *real* applications
>>over the air.

Nope. Linux at 1.2kbps sucks. The addition of AX.25 to Linux is like having
the toilet seat fall on your penis. I've been there, AX.25 in Linux sucks, any
AX.25 in Linux (JNOS, TNOS, ZZNOS), it all sucks. Linux should not be used
on Ham radio unless it is running at 1 Mbps or higher (i.e., spread spectrum
or microwave). WWW at 1.2kbps will cause only laughter.

>Linux on packet is so complicated to setup and keep running, that it is
>*very unlikely* that anyone but the computer enthousiast will use it for
>their packet work.

Hogwash. I've seen 10 year olds do it. They can do more than pass an
Extra upgrade and CW, they can do Linux. Old men can't do Linux, true.

>Besides, NNTP is much less efficient than the BBS user interface as far
>as channel use is concerned. The 1200 baud packet radio system (with
>many users on the same channel) is simply not capable to handle users
>reading their news with NNTP.

Efficiency doesn't matter below 1 Mbps. Efficiency doesn't exist below that
speed. Comparing NNTP to FBB at 1Mbps may teach you something, but
not the reverse.

>Of course we should move to higher speeds, but that seems more like a
>wish than a reality in many parts of the world.

Packet is dead. RIP

My wife and I are converting a school bus and moving aboard, taking her sewing machine, my computer (486) and "our" new 2m Icom 2000H along. I want to get into packet, she into ragchewing, neither of us has our license yet but we're studying.

I've been reading all the radio elecs books I can find but can't really find (or understand) the answers to some problems I have involving electrical systems- I really hope somebody can help me out!
- I want to install a bank of deep- cycle batteries to power the water system pressure pump, stereo and 2m rig. Should I wire all the DC power to the 2 poles of the batteries and have a special setup to recharge the batteries? The alternative seems to be to run all (-) lines to the chassis which would tie it into the auto electrics and (?) expose the delicate devices to all sorts of surges and spikes and otherwise dirty power.
- Since the computer's power supply puts out assorted voltages of DC, could I not just transform the 12V battery bank juice into tightly regulated power the PC wants and avoid having to wait for an AC hookup to use my PC/ packet? Would there be a problem having the 2m working on battery and the computer running off (possibly ungrounded) AC?
- Let's say I can find a 12V motor suitable to run my wife's sewing machine and replace the 110AC motor it has with that. Would there be any problems/ what problems would there be running computer and sewing mach. at once, assuming I have a bank of batteries with enough amp hours to cover the total draw?
- Would a better idea be to just get a massive inverter and a humongous battery bank and run everything off AC? Anybody got a spare $1750?

I hope somebody can drop us a line; we have to move aboard by Jan '96 and would like to have a few amenities in place
Thanks loads in advance-

4720. Re: Can I use my modem as a TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-25 00:00:00 UTC
From: Ian Brothwell <ibx@cs.ott.ac.uk>
Message-ID: <46lai1$nge@griffin.ccc.nottingham.ac.uk>
Source record: 40807

If you run packet software on your computer (Baycom, Digicom etc) then the computer does all the packet work and sim,ply needs a modem at the necesssary level of specification to hook the computer to the radio.

If you think of a normal TNC such as the KAM, PK232, KPC3 etc, thn explored inside one you'd find that a modem is one of the internal components of a TNC.

Ian.

: on a Sun Sparcstation 10, so I have plenty of CPU available to run
: the filter code. Years ago someone showed me a "recursive" digital
: filter which was extremely simple, replacing each audio sample by
: a weighting of the previous two samples (the weights determined the
: filter cutoff). Unfortunately I don't remember the details. Can
: anyone provide help, or at least some references to books or papers?

My recommendation for digital filters which operate at a cutoff frequency which is a farily small fraction of the sample frequency is to build them as an analog of the continuous-time state variable filter. It's basically a cascade of two integrators, with feedback from each to a summing junction at the input. A simple sampled-time integrator is accomplished just by adding a constant, k, times the input to the current value. For a simple two-pole filter, appropriate weightings for the feedback terms would be -1.41 for the first integrator output and -1 for the second integrator output. Add those to the input sample. The high pass filtered output is the input plus the feedback, and that's also what's fed to the first integrator. The constant, k, is chosen to get the right cutoff frequency, and is something like 2*pi*fc/fs... Did I remember that right?

The reason for this configuration instead of the canonical sampled-time biquad is that when the cutoff frequency is a small fraction of the sampling frequency, you have a LOT of trouble with roundoff. Certain coefficients scale as basically the square of fc/fs. But in that state variable simulation, the coefficients scale linearly with fc/fs.

: > check the loop filter to make sure it was working correctly?
: >

Well, I would say that reference spurs of -6dBc are higher than
expected. If the loop filter was at fault, then shielding the
VCO would have no affect. As further evidence of VCO radiation,
when I had the top cover of the unit off and had a receiver tuned
to the VCO frequency, I could rattle metal tools together off the
bench up to two feet away and the VCO would produce microphonic
responses. And a spectrum analyzer with a "sniffer" probe would
pick up a strong signal in the general area.

I suspect that there's so much of this radiation being coupled into
the PLL circuitry that it's either modulating the divided VCO signal
going back to the PLL chip or somehow modulating the charge pump
output, perhaps driving the filter into nonlinearity. Whatever the
mechanism, it doesn't seem to be related to a bogus filter, and
I did fiddle around with that.

I'd be interested in hearing other possible explanations though.

Regards,
L

Another thought on the "bash packet" vein:
I like point-to-point remote control and wireless data transfer (on non-traditional packet channels), which **some** packet
systems provide. All or most TNC's support text transfers and I really enjoy Digicom-64 and Baycom's abilities to transfer
exe files painlessly between these systems.
Digicom-64 has an almost completely ignored and unused feature of I/O via the C64 user port that I dearly love to play
with, using it to control relays, synthesizer inputs up to 8 bits, etc, as well as being able to remotely program another
C= machine via the online ML monitor.
I also find Packet Radio to be EXTREMELY useful for emergency communications or covering remote events such as our local
church Girl's Wilderness Camp which is usually held in the boonies far from telephones and (so far) out of cellular range.
Every time I've arranged for 2 or 3 in-town ops to monitor for traffic from the camp, it seems most of the time when the
camp calls in for more toilet paper, a girl lost her insulin, somebody's grandma died, etc, the town ops are eating dinner,
watching TV down the hall, or otherwise frustratingly away from the radio.
We tried using packet the last couple of years and it was great. Instead of getting upset because my town station wasn't
able to respond quickly, I just connected to his TNC via packet and left the message, order, etc, in his data or mail
buffer, upon which invariably when he called back he'd already taken care of the traffic. Neither end has to be "right
there" to effectively handle traffic. With my portable Digicom-64 systems I could even set up alarms to alert the
operator that new traffic was there.
I don't hear much about packet use in such situations but I think it is one of the few things packet is actually
good/superior for.
But for what most hams fight to do with it.... sending and receiving online or email traffic that takes hours via packet
and seconds via internet... packet is the pits.

Once upon a time this was the case. Most modern UUCP's don't suffer
this brain damage.

Note that I was NOT proposing the use of UUCP. I was using UUCP as
an *example* of how store-and-forward e-mail can be made to work
within the framework of the Internet domain name space without being
directly connected to the Internet.

As long as people insist on running MS-DOS they are going to be
stuck with monolithic software such as MSYS. If you want modules, etc.,
it's already been done. It's called FreeBSD.

>that a "dumb" digipeater.

Properly operating, a node will have no or tiny overhead over a digipeater,
which is well justified if there are any errors at all or the link is more
than one hop. This is because the acknowldgements from the node to the
sender are easily 'piggybacked' onto the repeat of the data packet. The
node only has to transmit once, though for a slightly longer time. Thus,
node users know that the packet has not been received at the node and retry
it exactly as you describe, with the overhead of only an acknolwdege packet
(but it can't be re-sent 'immediately', in either case, since a digipeater
or node may have to wait for the channel to become clear before repeating).
And the acknowledge from the far end stops at the node. The chance of
losing an acknowedge packet is much lower. If the retransmitted packet
were to serve as an 'acknowledge', there is a greater chance of the
original sender not hearing it since it is longer than the acknowedge
packet. The node has the additional advantage of being able to store
several packets. Current digipeaters dispose of the packet as soon as it
has been re-transmitted. This is probably the fundamental difference
between the two. Digipeaters of any sort are (thankfully) obsolete. When
digipeaters are used, all the callsigns are added to *every* packet sent.
This is unnecessary with a node, only two callsigns are included in each
packet once the connection has been set up.

In general, the existing AX.25 is not the optimum protocol for anything other than transfers over dedicated wire lines. It handles errors and multiple access poorly. In an earlier post, I proposed a few improvements, including:

* Forward error correction (level adaptive to number of errors received).
* Selective acknowledge and retry of packets inside multiple-packet bursts. Combined with more than 7 outstanding packets, this would work better than the "packets longer than 256 bytes" proposal, especially in case of errors.
* Deterministic access rather than random.

Most of these could be done in a way that is backward-compatible. For example, DAMA is a deterministic access technique that has been kicked around for quite a while, but not widely used.

I think you meant 'g'. 'G' is an SVR4 thing.

Both 'g' and 'G' support packet and window size negotiation. The
historical defaults for 'g' are 64/3. The protocol supports up to
1024/7, but coding bugs in the original implementation caused values
larger than the default to overrun an internal buffer, resulting in
SEGVs on many systems. (Increasing the window size almost always works.
Increasing the packet size can result in lossage.)

>I don't have my copy of Chesson handy, but I vaguely remember that 512
>byte packets were ok, and you could certainly have a 7 packet window.
>That's enough to hide the turnaround and latency of even V34 modems.

Many modern UNIX implementations will let you crank 'g' up to 1024/7.
A notable exception is SCO which pukes if sent anything other than
64/3, although it *will* negotiate (and use successfully) 64/7 in the
other direction. I'm running 'g' at 1024/7 (both ways) to a system
running BSD/OS 1.1 (running the UUNET derived UUCP implementation). It
easily maxes out the V.34+V.42bis modem link.

This is really getting off topic :-)

UUCP is pointless in this application. The reason UUCP implements error correction is to get around errors from noisy phone lines. AX25 virtual circuits *already* *provide* error correction and sequencing. Adding another layer is redundent. Also, running a packet protocol on top of another packet protocol will result in horrible throughput.

Running SMTP directly over an AX25 VC will work just fine.

It should also be noted that it is a level 2 connect, not netrom connect that is made by using the alias with ssid. The same thing can be done with TheNet/NetRom (unless valid calls is turned on). It makes a good way to force a level 2 connect when you want to keep overhead down for one reason or other.

>not the reverse.

Of course, it may not make sense for the 1200 baud users to access
BBSes using NNTP; these guys may still want the relatively clunky,
homegrown interface that we all know and love (right).

But, in terms of forwarding traffic between BBSes, NNTP is an
interoperable standard. I tend to believe that amateurs are going
to have to come up with something a lot better than "we can't do it".

Frankly, the Internet RFCs are a ready made source of interoperable
standards in wide deployment. The question really shouldn't be
"what protocols can us hams invent all on our own?", but the question
should be "what do we have to develop to make the most effective
use of existing standards in our particular environment?".

>>Of course we should move to higher speeds, but that seems more like a
>>wish than a reality in many parts of the world.
>
>Packet is dead. RIP

Now that I've really had a glimpse of the light (part 15 900MHz 2Mb/s),
I'm torn between two extremes:

#1. Hams are still quibbling over which appliance radios can do
9600 baud baseband data out of the box, and few of the appliance
radios can. We're figuring out where to sit in the lifeboat while
the Titanic sinks.

#2. It just isn't *that* hard to build reasonable high speed packet
gear. Running Manchester encoded data from an Ethernet controller
over a direct-sequence spread-spectrum link isn't *that* hard; as
far as I can tell, using a chipping clock which is a small
multiple of the data clock produces a system which can lock up
quickly and isn't too hard to build. I've been stocking up

on parts to do just that, now all I need is time.

4736. Re: Help---First TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-27 00:00:00 UTC
From: Ian Brothwell <ibx@cs.nott.ac.uk>
Message-ID: <46r4ak$9ur@griffin.ccc.nottingham.ac.uk>
Source record: 40823
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

With your spec requiring HF as well as VHF then are you looking for a TNC that offers modes other than just packet?
If this is so then you could consider:

Kantronics KAM
AEA PK232MBX
MFJ 1278

OR you could be more wide-ranging and get:

1. TNC for packet on VHF and
2. Dedicated HF multimode equipment such as BMKMulty software and Multyterm interface - see http://cs.nott.ac.uk/~ibx/BARTG/Sales/

Regards, Ian G4EAN@GB7BAD or ibc@cs.nott.ac.uk

:
: >>Speaking of Linux on packet, you would think that with the development of
: >>AX.25 in the kernel that people would want to run *real* applications
: >>over the air.
:
: Nope. Linux at 1.2kbps sucks. The addition of AX.25 to Linux is like having
: the toilet seat fall on your penis. I've been there, AX.25 in Linux sucks, any
: AX.25 in Linux (JNOS, TNOS, ZZNOS), it all sucks. Linux should not be used
: on Ham radio unless it is running at 1 Mbps or higher (i.e., spread spectrum
: or microwave). WWW at 1.2kbps will cause only laughter.

You actually run 1200 bps??? I gave away 1200 baud tnc's, heck I gave
a 1200/9600 tnc away to the Salvation Army's ham station since those
speeds suck so bad. I find it totally amazing that people still run
1200 baud. 9600 with Linux actually works Ok, one of the tricks (and
this is true and a proven fact by anyone who has done *real* networking
on packet) is that you just plain can't support the lowest common
denominator on your network. Just because some guy has a radio that
can't decode anyone on packet running something shorter than say 200 ms,
you don't change everyone to run 200 ms or longer just for that one
person. You run a LAN as fast as it can go and optimize it for maximum
performance. Then you can have users that run other ports where the
other folks can go who don't have the capability of running on the LAN.
Myself and another ham (N8KDL) were setting up various 9600 tnc's and
radios and we were typically getting 550-650 cps, and I was running
Linux. Nobody else in my area could even approach those speeds because
they didn't understand that the RF is the important issue and that you
can't run long transmit delays and support everyone on the same
frequency. Linux runs fine over packet when you run your radio ports
like they should be.

: >Linux on packet is so complicated to setup and keep running, that it is
: >*very unlikely* that anyone but the computer enthousiast will use it for
: >their packet work.
:
: Hogwash. I've seen 10 year olds do it. They can do more than pass an
: Extra upgrade and CW, they can do Linux. Old men can't do Linux, true.

Isn't it funny that people will try something new and learn all about
packet just to get into it. Then when you try to change something they
flat out refuse to learn. Now I don't expect everyone to learn
something new, but nearly everyone is fully capable of learning a new

system. As long as people don't change we'll never progress. Packet had a lot of hopes when it first started as being something useful, now it's basically just a toy. We can probably blame both the people that refuse to learn, and also the TNC manufacturers for still selling the same old 1200/9600 baud systems for such outrageaous prices. As technology progresses you typically see prices drop (the reason why 14.4kbps landline modems are about $40-50 now, and commercial wireless modems have been becomming more feasible and cheaper to run), ham radio prices don't seem to drop and progress is slow because companies know they can get rich off of what they can sell. No reason why a 9600 tnc can't be sold for about $50.

Also what about when someone releases an AX.25 stack for Windows 95? I'm sure it'll happen, and I hope it does. You're going to see a lot more people want to run the TCP/IP applications in Windows 95, and that's an easy system to setup.

: >Besides, NNTP is much less efficient than the BBS user interface as far
: >as channel use is concerned. The 1200 baud packet radio system (with
: >many users on the same channel) is simply not capable to handle users
: >reading their news with NNTP.
:
: Efficiency doesn't matter below 1 Mbps. Efficiency doesn't exist below that
: speed. Comparing NNTP to FBB at 1Mbps may teach you something, but
: not the reverse.

Well about anything runs good at 1 MBps :) The faster you go the less likely you'll need something like compression. It can slow you down when you start to approach very high speeds. The current way that NOS handles NNTP isn't too bad, it's used a lot by locals in my area where people just poll the news server that's setup for the Detroit area (netnews.n8oej.ampr.org), but I will admit that running something like the Tin newsreader is a bit of a hog over the air. I used to run that, but it gets annoying when it downloads the active file about 3 times just to tell me what newsgroups there are. I'd rather run that though then download every message just to read a few of them.

: >Of course we should move to higher speeds, but that seems more like a
: >wish than a reality in many parts of the world.
:
: Packet is dead. RIP

Sad, but true. There are some folks around the world doing productive things with it, but it's not very well known or accepted.

From: mats.peterson@haricot.ct.se
Message-ID: <46spb4$oji@mn5.swip.net>
Source record: 40832

Hello, everybody with a Yaesu FT-107M!

I have observed that the AGC on my FT-107M is a bit too slow for
working AMTOR/PACTOR, even in its so called "fast" mode.
Is there anybody out there who has any tip on how to modify the
FT-107 to get the AGC work a little faster? It works ok when I turn
the AGC off, but it would certainly be nice to have it on, because
as it is now, I am forced to ride the RF gain up and down as the
signal strength of the other station varies. Any other suggestions
of how to modify the rig to get a faster TX/RX switching are welcome
as well. I have looked everywhere in BBS:es and Mailboxes for any
kind of mods for the FT-107, but with no success.
Any help appreciated!

Best Regards
Mats Peterson SM5SXL mats.peterson@haricot.ct.se

>Hi gang, does anybody suggest me how to connect correctly the KPC-3
>with a Kenwood 2 m radio TM-201A?

Kenwood Mic Pin KPC DB9
1 (TX Audio) ------------------------> 1
2 (PTT) ------------------------------> 3
7,8 (Ground) -------------------------> 6

Kenwood Speaker Jack has Receive Audio ---> 5

Also -- Pin 4 of DB9 can be connected to an external speaker to monitor
incoming signal if desired,

All grounds can be connected to DB9 Pin 6 (TX Audio, RX Audio)

Pins 8 and 9 are also common grounds.

I have my TM201 wired as shown above, not using 8 and 9

Pin 7 of DB9 is not used unless you use one of several options that are
listed in the KP3 manual on page 98.

Hope this gets you on the air!

Aloha from the 50th State!

Baycom software is easy to use and has a great interface.
The hardware is inexpensive and reliable. It's a great way to start
out. You should be able to get a new one for $30-$35. Worry about
upgrading to something more expensive when you decide you want to
try 9600 baud, APRS or whatever. Worked for me.

Think of it this way: Was your first 2-meter rig a used HTX-202 or
a new IC-271H?

Yes!

I think what you are looking for is a MOO, a Multi User Dimension Object Oriented. It works a lot like Packet Cluster. You have nodes that are linked via the Internet and everybody goes in a node via 1200- or 9600-baud packet. It looks like spokes on a wheel and all the centers are connected with on another. A group out of San Francisco State gave me a demonstration at the recent Pacificon '95 in Concord CA and I was really impressed. Here's some Web address to find out more:

http://charon.sfsu.edu/moo.html

>now, all AX.25 maxframe is recommended to be set to one (Karns study).

Unless the network is collisionless and error-free, which can nearly be achieved by the use of a central realtime repeater system in each LAN. Then maxframe is really not important.

It's clear to me that local uncontrolled station access should be by means of a LAN repeater, and that links between LANs should be unshared and preferrably full-duplex.

This requires a bit more equipment and some degree of planning.

Oh yeah, sure. At the current throughput of most packet channels, it
would take most of the morning to paint the ARRL logo on your screen.
I can just see people browsing around at that speed.

Jeez, it would be faster to chip it into a stone tablet and tape it
to a duck that waddles from one node to the next. Get real.

Yes, it is the same chip. A generic 128K x 8 low-power SRAM. The only
possible difference is that the CPU clock rate in the 9612 is 12.2 MHz,
but the KPC-3 runs 7.3 MHz. This probably means the RAM cycles
require faster access time. Most likely a 100 ns RAM (that is about the
slowest you can buy) is plenty fast for either though.

"Why a duck?" -- Chico Marx

OTOH, the authors of that article were quite explicit in saying they
were using 9600-bit/s links. And those fortunate enough to have a
56 kbit/s network in their area would find HTTP over the network
quite acceptable. Who knows, maybe this kind of technology will
encourage the growth of faster packet networks.

Hello All, A few of us here at the University of Maine have the DJ160T handhelds. We would like to connect them to packet radio via the baycom software and hardware. However, the connections that listed in the .doc file do not work for the radios. Has anyone had any experience with connecting the 160's to the baycom units?
Any help is appreciated.

Are there a packet radio equivalent to ethernet broadcasts where a packet can be sent to some group of other stations? Seems like it would be useful for dxclusters where a notification is sent to all users at once.

First off, don't get cheap on us and expect to do see the Web on packet. Pay the money for a real connection to the Internet, but build your _own_ packet radio Web instead! Replace today's packet radio with HTML and hypertext. Don't include the ARRL logo and don't use the current throughput. Put on your experimentor's cap and get back to work! Just send ASCII text instead.

>>Jeez, it would be faster to chip it into a stone tablet and tape it
>>to a duck that waddles from one node to the next. Get real.

Re-read the article, Brian; we don't want to go on the Internet. And just think if it were combined with spread spectrum...

Thanks, Jon! :-) As he said, we wrote the article to emphasize that with the creation of local packet webs (forget the Internet!) using high-speed digital links is only limited by your inactivity, not technology. We presented a recipe, now cook it. The question is not whether it _can_ be done, Brian, so please don't discourage anyone else with your pessimism. Why, I know someone doing this with 1200-baud and a Powerbook!

Hostmaster is a commercial DOS program distributed by Kantronics, the same company that designed and manufactured your friend's TNC. It is sold through Kantronics dealers. It is not available as shareware.

>he's looking for a windows program... he's tried the ones on the latest

: Could work?

: Actually, Don, it already does work...on 9600-baud! That was the point of the July
: '95 QST article. Steve built the equipment and tested it while at the Naval
: Postgraduate School in Monterey CA. You could use 56 kb, but if you just wanted to
: create a packet version of the Web (forget the Internet - pony up the dough and get
: a commercial account) it's a no-brainer.

It could even work on 1200 baud if the pages were kept small. There's no reason to even consider graphics at this point. Keep it like LYNX and it would work. I see your point about not actually connecting to the Internet. It would be really nice and very easy to maintain if all connections (mail, news, messages, etc) could be in a text-oriented HTML format.

Oh, and what about compression? Why have there been no low-speed packet formats devised to incorporati compression? Many of the files I transmit and receive, if compressed with PKZIP get really small when compressed. For example, have the program compress the data before it packetizes it. Sure, people couldn't as readily monitor traffic, but the point is not to obscure the message, only facilitate faster throughput.

That driver was not really functional. I believe you want to get the latest
JNOS 1.10L off of ftp.ucsd.edu:/hamradio/packet/tcpip/incoming. It also has
the old DRSI driver, but I don't think anyone uses it. They all use the SCC
driver, which has a DRSI enable flag in it.

Hi,

Look for Winpack4 on compuserve or at demon.uk
It is a nice little Windows program that I believe is
freeware it seems to work quite well. IMHO the host
mode software available for Kantronics and AEA are
a bit over priced ie. cost more than the TNC so this
effort is refreshing. Good luck 73 de Jerry

4784. Need to build high-speed digital link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-02 00:00:00 UTC
From: jekucfjc@w254zrz.zrz.TU-Berlin.DE
Message-ID: <47a6fk$dm4@news.cs.tu-berlin.de>
Source record: 40721

I'm working on a project to wirelessly transmit data (QPSK
encoded) over a distance of about 50 m.
The stream is one-way only and will be error-corrected.
Does anybody know companies that build chips to mix the
baseband to the 400 MHz range (UHF), as well as proper filters
for the frequency band? The frequency will be between 430 and 440
MHz. The bitrate will be 2 Mbps (about 150 m wavelength for one bit).

Also, I'm looking for manufacturers for the QPSK encoder chips.
The decoder chip will itself tune to the data rate, based on the
signal.

Still, the main remaining task is to mix the baseband to this very
high frequency band, which is reserved for low-power amateur equipment
over here in Europe.

Any contacts would be greatly appreciated.

Jens

Could work?

Actually, Don, it already does work...on 9600-baud! That was the point of the July '95 QST article. Steve built the equipment and tested it while at the Naval Postgraduate School in Monterey CA. You could use 56 kb, but if you just wanted to create a packet version of the Web (forget the Internet - pony up the dough and get a commercial account) it's a no-brainer.

You don't mention the model of your TNC. If you have any Kantronics TNC
look no further than the home page below. Have fun!

You could try UltraPak, which is available from ftp.demon.co.uk in the
directory /pub/ham, filename upak30b.zip.
It has loads of features and works with just about any TNC except Baycom
modems. Version 4.0 is close to release also.

Host Master is commercial software, so you won't find it on BBSs for FTP
sites. You can, however, order it from Kantronics. BTW - It only works with
Kantronics TNCs.

Hi Terrance,
I am running Graphic Packet ver. 1.61b by Ulf Saran on top of a
TFPCX ver. 1.10 Baycom driver by DG0T. This system works well on my
386Sx 25MHx laptop. Graphic Packet is what its name implies, a
graphics based packet program, which runs with DOS. All of the bells
and whistles are included. When you first install it the prompts and
labels are German but these can be changed to English using the setup
command.

I doubt that you will find a Windows baypac packet program.

...and if you have the time to wait for NETROM to actually find a route through
the network. In practice I have never seen Netrom or Rose to really
work. I would say 99% of the users still prefer to connect from node to
node... The only sytem I know that is really capable of autorouting is
Flexnet here in Europe. This may be due to our network here (the densitiy
is much higher, we have hundreds of nodes in Germany), but I have never seen
a NETROM or Rose with 500 reachable destinations. And *reachable* means, you
can type "C db0xxx" and you have a connect in less than 1 minute (of
course not to the next node 5 miles away)...

UltraPak 4.0, due out in a few weeks' time will support MBL/RLI and
compressed forwarding and will have TPK-like monitoring of unproto
beacons from FBB BBS's as well as fully automated and scheduled downloading
of mail into your own PBBS.

From: WA6MHA@WB6WFH
Subject: WIRING OF TS-440 ACC-2

USING THE ACC-2 DATA JACK ON THE TS-440/TS-680 FOR DIGITAL & RTTY MODES

The TS-440 ACC-2 jack (13) pin can be used for your TNC hookup with
great success. The advantages are :

1. You can leave your microphone connected at all times
2. You can turn your speaker volume up and down without affecting
the RX level into your TNC.
3. It keeps your whole setup simple and reduces it to one cable.
4. Your Mic gain will now be set at 7 or 8 on its dial. YES!

The pins used on ACC-2 are: (see page 11 of TS-440 manual)
(3) Data output. This is a constant 300mv output that will go to your
TNC audio input lead. Note: This audio level is also the audio output
on the RCA jack used for FSK output. This is where many hook up their
phone patch.

The audio output may be too hot for some TNC units. If so, you
will have to pad down this level with resistors. My KAM wants to see
50mv and it's seeing 300mv. So far so good!

(4) Microphone shield (Ground)

(9) Microphone Mute. When pulled to ground, this pin will mute the
front Mic connector ** AS LONG AS THE PROCESSOR SWITCH IS OFF!**
If the switch is left on, the audio is pumped up too high to mute.
Connect this pin to your PTT wire from your TNC and also connect
the Cathode of a switching diode (1N4148, 1N914, etc). The Anode of the
diode will go to pin (13). (The cathode is the bar)

When pin 9 is pulled low by your PTT wire, the diode will cause
pin 12 to go low enough to put the TS-440 into transmit. This will both
mute the front Mic jack and transmit at the same time. Works great!

If the diode is not used, and the pins are just connected together,
the front Mic jack will mute itself when used. NOT A GOOD IDEA!

(11) This is your transmit audio in, from your TNC.
Setting of the MIC gain on front of radio:

1. The audio level in wants to be 500mv RMS (1.5 vpp or so). For the
KAM remove its jumper inside. This will give you max audio out of the TNC.

2. For the PK-232, turn up the audio output pot until you get 500mv
or so RMS. You may also want to set it to make your TS-440 mic gain pot
read where you want it. (MIC) will run around 7 or 8 for digital with
the KAM. I'm not sure for the PK-232. More level into the TS-440, lower
numbers on the audio pot (MIC)

(12) Ground for audio shield

(13) Standby (transmit). This connects to the Anode (no bar) of the
diode from pin (9). When pin (9) is pulled low, pin (13) will go low.

To sum it all up:

A. You will need:
1 ea diode, 1N914 OR 1N4148
1 ea 13 PIN DIN CONNECTOR
1 ea TNC cable with appropriate connectors

B. Remember to keep the PROCESSOR switch OFF!

C. Set the Mic gain to 7 or 8 and look at the ALC, keep it
in the red, as per the book. Lower power, longer transmit time!

This hookup in being used with three TS-440 radios and is working
great! Go slow and solder carefully. Please recheck your work and
then plug it in! 73 Glen, WA6MHA@WB6WFH

And several unfortunate facilities. It is a good program but I wish the author had used kiss mode or hostmode. Then one could have multiple connects, more than one TNC, etc. Graphics Packet is excellent, but does not yet work under windows.

The facilities of winpack4 are very good for the beginner, logging in to one thing at a time, reading the BBS mail, monitoring the DX cluster, PMS facility, speech even.

What it would be nice to see added by the author (he reads this group) are:

Multiple connects

Auto BBS favorate subject pick up.

Grabing of BBS downloads from other users - if you can hear the BBS well, get G0whatsits copy of the news instead of downloading it again.

QSO Spy facility, especially the DX cluster spots whil not logged in.

More scripts

A way of getting rid of the four boxes at the bottom of the screen

A channel monitor facility while connected.

A display of retries, link quality, channel useage.

Rig control - auto QSY and scanning. Lots of rigs have RS232 control now.

Finally, a way of making the DX spots faster - e.g "G0MJW 23cm" as opposed to G zero MJW on 1 2 9 6 . 2 Megahertz.

Some (most) of these facilites are only practical in kiss mode or host mode. Most TNCs have kiss mode at least..

Still, it is a great program.

Andy, thanks for the tip on the Phillips chips. I am right in the middle
of new synthsizer design and found that only writting the UK would
produce any form of answer. I had heard National was involved in a new
sythesizer line but primarily for freqs above 850 MHz. I still need
something for the ordinary 3 to 30 MHz range for ham radio projects. W6HDO

You can encrypt your files and then FTP them, or encrypt your
mail.

Basically encryption should be done at the hardware level.
You can buy DES TNC's from Kantronics I hear. Course these
wouldn't be any good for KISS, but rather Host mode or some
such. I believe these are popular in commercial use.

A good way to encrypt would be to build a couple of 9600 TNC's
and change the scrambler start code. Right now it is a fixed
polynomial, but by changing it each day, you can get privacy.
It wouldn't be secure enough for a concerted attack (recording
the transmission, and replay through all the codes) as this is
only 17 bits I believe.

Best bet is to encrypt the data first, and then transport.

Do it right. Buy a Kantronics KPC9612. It does both 1200 and 9600. Use
it with your voice radio for awhile to get the hang of packet then
once you zero in on the frequency you'll be using get a dedicated data
radio like the Tekk KS900L or MFJ (around $120).

Murray, take it from one who's been through the wringer with Philips - design out the Philips part and replace it with a National LMX23xx series. Philips seems only to be selling extremely large quantities to a select few customers.

4810. Hostmaster?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-03 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.3264.7582.0NFBB74B@woodybbs.com>
Source record: 40747

Subject: Hostmaster?

>>have a friend looking for a program called 'Hostmaster' ...

Have him obtain a Test Drive release of KaGOLD instead of the anemic HostMaster...

Please consider consider these Features:

ANSI Graphics on ALL sessions, simultaneously with KaGOLD, including automatic capture to disk. Not supported in Host Master.

Callbook Support -- four (4) CD ROMS (Amsoft, Buckmaster, QRZ, SAM) and SAM disk based.

Conference Mode -- Automatic, Manual, Remotely Started

External User-defined commands that allow remote users to request callbook data, start conferences, get files, list directories, and more

Runs in Windows, Desqview, OS/2, DOS, Laptops, Desktops, 8088 through Pentium, 16550 UART support.

Now, here are some specific things you may want to compare:

Host Master resets and disconnects all stations when it starts up.
* KaGOLD retains connects, does not reset your tnc on startup.

Host Master will not exit in any mode other than PACKET, which means you cannot exit and leave your ARQBBS on, or leave the unit in NAVTEX.
* KaGOLD allows you to exit in any mode you wish.

Host Master has small scrollback buffers. Default is 100 lines, and the access to the scrollback is cumbersome.
* KaGOLD has huge scrollback buffers, all dynamically allocated, and managed automatically.

Host Master has a very limited Help "system" (screen) with no help on modes, or parameters.
* KaGOLD has a complete cross-referenced help system that covers all parameters and operating modes.

Host Master uses a "command channel" to set and view parameters.
* KaGOLD allows you to set/change any parameter from any screen.

Host Master has a single binary file transfer system, and only compatible with other Host Master users. Further, it uses a "pacing" timer approach which is inherently unreliable.
* KaGOLD supports YAPP, RAW binary, and supports the same system as in

PkGOLD for the AEA PK-232 and PK-88 tncs, and other GOLD protocol
software (dspGOLD, KaGOLD for Data Engine, etc).

Host Master has no Conference mode, and multiconnects are difficult.
* KaGOLD has manual and/or automatic conferences, allows multi-node
conferences (mixing KaGOLD and PkGOLD conferences)

Host Master does not work reliably in Windows.
* KaGOLD runs under Windows, Desqview, OS/2, DOS 2 through 6, and
in VPIX under Unix for the PC. It is "multitasking" aware.

* KaGOLD -- Reliable, fast, user friendly, more features, the best!

The Test Drive version is available on ATTENTION to Details landline
Amateur Radio BBS at 909-681-6221. Download either KADEMO.ZIP or
KAGOLDTD.EXE.

Hi, folks,

Regarding my frantic hunt for the TCM3105 chip for the Baycom packet modem:
I just got off the phone with David (extension 563) at JDR, 1-800-538-5000.
They are $8.95 + shipping; total came to under $12. He says that they have
about 400 of them.

They now have 399 :-).

Thanks to all for your suggestions about where to look.

I know I've never had a problem getting small quantities of the
Motorola MC145xxx parts. The '190 and '200 are good to 1.1 and 2.0
GHz, respectively.

Hi James:

Try EASYTERM for Windows. It is a full featured program for packet and
other digital modes.
Contact: M.V. Henley's, Inc. POB 2154, Edgartown, MA 02539
1.800.336.7796
$49.95 plus $3.00 s/h

I downloaded a demo disk not long ago and was pleased with the
performance and features. It operates in the host or terminal modes.
Supports the AEA and Kantronics TNC's.

I also think that thre is a program called, KAWIN. You can find a demo
of it on Compuserve Hamnet forum. Also there is a program from a
company in Orlando, FL. I also think I saw a demo on the Hamnet forum
for that one as well.

Give em a try. Have fun. 73.

I understand a little better now abt the N6TTO DRSI driver...I was under the impression that it was an external driver, like AX25.COM for the BayCom family. Instead, it appears to be something that is part of the compile to get to a NOS executable.

I am now puzzling out the ATTACH SCC command that is part of the GRI NOS that I have been working with.

Thanks for the help.

BTW, does anyone know what a "divide error" means?... :)

4827. Z-180 series laptop hard drive

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-05 00:00:00 UTC
From: mconner@monarch.papillion.ne.us
Message-ID: <47hrom$7kh@nlcnews.nlc.state.ne.us>
Source record: 40764
Cross-posted to: comp.sys.zenith,rec.radio.amateur.digital.misc

I recently bought a Zenith Z-180 series laptop (ZWL-184-97, 8088 processor) for use as a portable amateur radio packet station. The computer has two 720K floppy drives, and I'd like to replace one of them with a hard drive.

1) Can a hard drive even be installed in this system? Does this disk controller even deal with hard drives since it came with 2 floppies?

2) What type of hard drive does it take (MFM, RLL, etc)? What connector does it go to? I wouldn't think it would hook on the same connector as the floppy drive does, but there aren't a lot of choices internally.

Unfortunately the manual is not at all clear about this, and gives no instructions at all about installing a hard drive, though it does talk about them being an option.

Also, the date and time change (sometimes to 1/1/80, sometimes to something in 2045) every time I power up or reboot, even when the DC power stays connected. Anyone know the cause (or the cure) for this problem?

It's possible that the '184 had hard drive capabilities (the '183 did
not). If it did, it's probably early ide or mfm

>Unfortunately the manual is not at all clear about this, and gives no
>instructions at all about installing a hard drive, though it does talk
>about them being an option.

It would have been a factory installed option, I believe, adding even
memory to early portables was a chore!

This is an easy one --- it does this because it's an XT clone --- no
backup battery or real time clock chip. All you can do is add date and
time commands to your autoexec.bat (short of getting something like a
smart clock that sandwiches between bios rom and socket...)

>I've got an older KAM ... originally was a firmware version 2.8X machine
>as I recall. Anyway, it has been upgraded (3 years ago) to 5.0 AND I
>also installed the TAPR DCD State machine modification in it ... on the
>VHF side, as I recall.

I should leave this one for Karl, but in case he's not reading the mail
I'll give a shot.

>Here's the question(s):

>1) Can the KAM be upgraded to the newest rev (8.?) ?

I believe any Kam can be brought up to 8.0.

>2) What does it take, and what does it cost?

You'll need the Kam Enhancement Board. It's a daughter board that supplies
the hardware changes to support the new features of the Kam+. You can
purchase it direct from Kantronics, but you might find a slightly better
price from a dealer, such as HRO.

>3) Any problems with the TAPR DCD state machine mod already being in
there?

I haven't a clue. You'd better get a answer on that one before proceding.

>4) Any other comments?

You're really going to enjoy the improvements incorporated in the firmware
and hardware between 5.0 and 8.0.

>It's illegal to encrypt amateur transmissions. I've been worried about
>simple compression since it can appe encrypted.

Don't worry Gerry! I spoke to an FCC engineer about this years ago regarding the transmission of an arc file via packet. Although it might "appear" that it is encrypted, by definition it is not. The fellow I talked to said there would be no problem with this at all, but suggested that it might ease my mind to send me the unpacker program for the arc file. The way he talked he seemed to be more interested in this program for his own home computer than using it as a method of surveillance for us Ham folks. I suspect he had more things to worry about than what my packet station was doing.

I, for one, don't worry about esoteric stuff like that anymore either. Maybe I should, but I can't get up enough energy to stay up nights over it. Better to worry about getting the budget under control and arresting the crooks in society than what things might appear to be.

Your typical TNC will collect the information for you. Just ask it
for "mheard" and "ndheard" to get the listing of the most recent 20 or
so stations it has detected.

I found that many BBS's have files of entire packet networks and freqs
they use, including maps (as well as text can be used to make a map...)
You have to find the first BBS, though.

> -Adaptec
> -Wearnes Beethoven
> -Echo Speech.
>
> If you know where I could buy one (new or used), please e-mail me or
> reply to the newsgroup.

The Echo card is still available, I think. Randy Cole of Echo can be
reached via e-mail: cole@netcom.com.

Their address is:

Echo Speech Corp.,
6460 Via Real,
Carpinteria, CA 93013,
USA.
805-684-4593 (voice)
805-684-6628 (fax)

A colleague of mine got the Echo card a few months ago, and is very
pleased with it. I got two of the Cardinal cards (no longer available) -
one for work and one for home use. Like the Cardinal cards, the Echo
card runs all the PSA DSP stuff that is available, like the packet modem
software you mention.

Yes Mark is right. It is also ok to use 'uudecode' and 'uuencode' too
if you want to send an .EXE, .COM, .GIF, ect. The only possible problem
would be if you were to post to a BBS. Many sysops 'screen' mail and
bulletins, to protect themselves from transmitting illegal data (cuss
words, business, ect.). If the sysop comes across a 'uuencoded packet
message', and doesnt know what it is...he will definitly kill it. Even
if he does know what it is, for him to screen it, he must decode it
first. I certainly can see this snowballing to the point where the
sysop says "no more...".

>the network. In practice I have never seen Netrom or Rose to really
>*work*.

<stuff deleted>

N>73' Alexander DL8AAU

Alexander (et. al.):

The key to my statement above is __properly configured__.

For a LARGE network, the default NET/ROM parameters aren't anywhere near
optimum -- and to get the parameters adjusted properly requires
cooperation from all of the NodeOps in the area.

Properly configured, NET/ROM is fast.

ROSE requires a central "operations center" to distribute routing info
to the nodes -- and probably at least some intelligence in building
those tables.

I can't comment on FlexNet since it isn't used here -- it may be that it
simply has better default settings.

Yea, I'm not going to worry. I am planning on a custom compression
(derived from public domain) but will have (if this ever happens :) a
freely distributable receiver app if it already doesn't esist in the
public domain.

Compression is not encryption! Encryption is the intent to conceal the
communication.

Source record: 40779

jimbo@panix.com (James C. Brost) wants to know if
a Macintosh can be used to send and receiver CW, and
if so, what software there is.

I haven't actually done it, but I'm quite sure it can
be done. I have seen listings of ham software for the
Mac, and I'm quite sure that I've seen CW software mentioned.
I'm sure somebody who's actually used some software will
post something specific.

I did want to mention one rather neat piece of software for
the Macintosh. It's called "Chipmunk BASIC", and is a
"tiny-BASIC" interpreter for the Macintosh. It's rudimentary,
but as the author says, a computer isn't much of a computer
without a BASIC interpreter. I don't recall seeing any mention
of a registration fee; it is a freely distributed program.

I found it at a store selling "packaged" shareware, but I also
recall seeing it uploaded to a Mac BBS.

It is useful to have BASIC for the Mac, but what makes this
program worth mentioning is that built into it is the capacity
to send morse. There's a command that will parse a string of
alphanumeric ascii characters, and output it as morse code
from the speaker. It would be an easy way of creating a code
practice program; include the whole interpreter along with
the BASIC program.

Unfortunately, it's meant for later Mac's and the morse
feature does not really work on my Mac Plus. I assume that's
the problem, and not that there's a bug in the program.

>
>
> 73' Alexander DL8AAU
Ah, yes, but how many nodes can it route to?? Maximum 600, according to Gunter DK7WJ. You see, the problem you describe has to do with AWFUL network architecture (layer 1, radio links and the like), NOT with the protocol (TheNET, ROSE, FlexNet, usw.) being used. If us americans would get off our butts and build a network like that in Germany, then our networks would perform that well, too.
(For the uninitiated: Most of the german network is 19k2, full duplex, dedicated point-to-point links on quiet channels. Performance over a few hundred miles is less than 10 seconds latency. Transfer of multi-megabyte files is commonplace, with little impact on the network).
The BIG problem with FlexNet and TheNET is that they do NOT use hierarchical routing, and thus are limited in the maximum network size with which they can function. ROSE doesn't have this problem.
Don't misunderstand: I am convinced that, except for that one fault, FlexNET is the very best amateur networking system on the planet. Sure, rose routes better, but it has other faults. TheNET is nice, too, but not fault-free.

(By the way: If anyone wants a copy of the FlexNET software, along with an application developer's kit, just send an e-mail to my compuserve address, and I'll tell you how to get it.)

This is really one of the main problems but unfortunatly not the only one.
There are still several things in the NETROM protocol will render it useless
for large networks. Keep in mind why and for what hardware it has been developed.
It is capable of running on a small Z80 based TNC. The router supports
"autolearning" of new routes once it receives "broadcasts". This was needed in
1987 when PR was an 144.675 (at least here in Europe). Now are the 90s and
we have dedicated links between our nodes and there is no use for autolearning
(have you ever tried the "Nodes" command after a big tropo? Interesting...)
Because of "compatibility" each node transmits as a broadcast all known nodes
to every other node. This is nonsense of course if you have dedicated links.
Take our digipeater (DB0DAR) as an example. It has one NETROM neighbar (DB0EAM).
It has to send all 150 nodes in a broadcast frame to DB0EAM every 5 minutes!
With no information, as DB0EAM exactly knows which "nodes" it can reach. DB0EAM
just needs to now which nodes could be reached via DB0DAR which is none but
DB0DAR itself. But this overhead is "compatible"...
Flexnet uses a adaptive algorithm to control the amount of routing information
on the links. So if there is heavy trafic on a link the exchange of routing
information is reduced. This is not possible with the current NETROM protocol.
First as the broadcast is transmitted as unnumbered UI frames there is
a high possibility that the information is lost. Second as the obscolence counter
is used to find out if a route is still usable the broadcast has to be repeated
very often. In Flexnet all this is done in a L2 qso. If this L2 qso dies, the
router knows that this link is unusuable. Very easy, isn't it?
One of the key features of the NETROM protocol was its capability to
have a L4 qso that won't die when a link dies. This was nice with all
the L2 QSOs between TNCs using ASCII terminals. Today the average computer
used for PR is about 10times faster than the one used in the node and we
have protocols (i.e. TCP/IP) that are superior to NETROM in this aspect.

But TCP/IP won't run properly on NETROM as NETROM is currently not compatible
with AX25 as it only allows PID $F0 to be used. Furthermore the normal
way of connecting "C destination via digipeater" will not work. This lead
to interesting solutions by letting the TCP/IP station apear as a NETROM
node to the digipeater.

|> Still, there is little we can do about links with 80% packet loss rate.
|> (this software actually measures it)

Good idea, Flexnet does that for 1 1/2 years now.
|>
|> Rob
|> --

I think that it is clear from the above mentioned problems that
configuration is not the only problem of NETROM. There are some problems
that are related to the protocol itself. I'm not saying that these
problems cannot be solved but I doubt it (mainly because this means
being incompatible with NETROM).
Flexnet was written to avoid these problems. As it was never designed to
be compatible with NETROM this was quite easy but lead to the problem that
we now have 2 systems here in Europe.

4849. Santec ST-144 and Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-06 00:00:00 UTC
From: guillory@phoenix.net
Message-ID: <47lavi$8or@gryphon.phoenix.net>
Source record: 40783

I have all my packet gear together but have decided that I now
want to interface a Santec ST-144 2m handheld to a
Kantronics KPC-3 TNC. Has anyone done this before?

The simplest way seems to be out of the weird 6 pin connector
used to connect the external speaker/mic jack. Does anyone
have a source for this connector?

Does anyone know who handles Santec stuff now? The latest
importer I have is Encomm, Inc. in Plano Tx. No phone or address
available.

Thanks for the help.

4850. Help - PK232/HTX202

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-06 00:00:00 UTC
From: "Frank B. Leppla" <Frank.B.Leppla@jpl.nasa.gov>
Message-ID: <47lel3$doa@netline-fddi.jpl.nasa.gov>
Source record: 40784

I am trying to interface my Radio Shack HT HTX202 with a PK232.
Everything seems to work just fine except for the PTT.

The interface is set up exactly like the documentation says.
The cable and all connections have been verified by a third party.
But I cannot get the PK232 to trigger the PTT. Manually keying the
HT and then telling the software to connect to another station
works ok. The resistor value is 30K. The capacitor is 0.1 microfarad.

All suggestions in the AEA documentation have been followed and tried.

Any suggestions would be appreciated. Please email direct if possible.

Frank.B.Leppla@jpl.nasa.gov

Well the Clear Lake Amateur Radio Club (CLARC
http://www.phoenix.net/USERS/biekert/index.html)
has started a packet "Wormhole" that is connected
to the local Internet Service Provider (phoenix.com).
(TNX Phoenix.com!)

When you get to the machine you get a Internet address
to send and receive mail along with some other
goodies. A great way to get a free account to use
in case your other provider goes down.

Cost? Well I had a big used spare 2m handheld, Kantronics
KPC-3 was $117, home made ground plane antenna
and to keep from hogging my real Windows PC I bought
a used Compaq Portable from TFI Ent. in Houston for $50.

The main use of my packet node is to connect into the local DX-cluster,
to receive DX information from other amateurs.
Everything else is painful!

As far as I know Echo Speech still produces PSA compatible cards. Unfortunatly
I don't know of a distributor in Europe.

|>
|>
|> what software is used with these to run 9600, assuming you have the

|>

There is software available from Thomas Sailer (HB9JNX). i.e. he has
done a driver for PC/Flexnet.

Contact dk7wj@db0zdf.#rpl.deu.eu (sorry, no email adress) for the whole
PC/Flexnet software including the PSA drivers or
Thomas Sailer tmsailer@stud.ee.ethz.ch.

I'am using a Cardinal DSP 16 with 9k6 and 1k2 and I'm impressed!
This is really the cheapest way to be qrv in 9k6.

Hello Brian,
Packet services do not compare with the Internet. However,
Think of it this way, Why do you have a two-meter mobile
instead of a Cellphone.
The answer is it is a hobby. Packet is just
another part of the hobby. If we get more interested people on
packet it will enable us to improve the packet networks and
hopefully someday have someting that appraches the Internet.

I was thrilled about packet a few years ago, and now use it only
for DX Clusters. The mail is horribly unreliable. The bulletins
are the ham equivalent of the home shopping network. It's foolhardy
to load files bigger than 25K through more than one node. Packet
isn't appropriate for a range of personal messages because more
"robust" language is prohibited.

IMHO, if packet is to be useful, it should be configured to support
emergency traffic with greater efficiency and reliablilty. Whatever
other traffic it supports is of little consequence. Sorry, that's
my honest opinion. It could be of great value for local and/or
national communications in time of a disaster. The "asynchronous"
signaling capability would allow personell to be used more efficiently.

As I found out too.

Also, how can one make it work with an FBB BBS? I find it does ln, then sends lr then sends b, all before the bbs has had time to send more than a few lines. A disconnect follows. Maybe it is the way the bbs is. I get the "no messages for you" response from the ln and then it sends the lr and b.

Yup. I agree. Don't think twice about it.

Now if you really want to attract attention, try transmitting some PGP
files!! That will certainly raise some eyebrows.

I'd stay away from Kantronics as well. They have never been the least expensive and have continuously attempted to 'lock' their customers in by being totally incompatible with any other tnc in terms of third party options or expansions. Want the latest firmware for your kpc3? Better call kantronics, no one else supports it. Want a new modem for your kpc2? Sorry buddy we did it all in software, ya can't upgrade it.

You get the idea....

There are less expensive good quality options. Maybe that dual port isa buss plug in, or a tnc2 clone, or the new Pacom fast tnc...

Don't be fooled..

Yes but 'uudecode' and 'uuencode' are not commpression programs, they are
ASCII conversion programs, and usually make the file slightly larger.

Just a point...still ok to use on packet tho.

I ran "Packy for Windows", a shareware program for quite a while and really
liked the separate window for each connection feature. Only left it because I
got a different TNC and Packy only works with 232. You can find it aound on
various BBS/ftp sites.

To key an Icom radio, the resistor needs to be less than 10k. To key
a Yaesu radio, the resistor needs to be 2.2k. To key the RS HT, a
value between 2.2k and 10k is required. 2.2k will work on all three
brands, but you may have to crank up the audio drive when using this
value with an Icom. Anything much larger than 10k won't key any of
them. The 30k in the AEA docs must be a typo.

>your kpc2? Sorry buddy we did it all in software, ya can't upgrade it.

Anyone extending firmware for a 100% TNC-2 compatible is stuck with the
capabilities of the TNC-2. This means limited memory (32k) and no room
to modify the hardware (single port).

On the other hand, the KPC-9612 can be expanded to 512k of memory, can
do 1200 and 9600 simultaneously, and includes a NET/ROM compatible node
capability in addition to the mailbox, etc.

As to cost, compare the KPC-3, PK-12, PacComm and MFJ units. No one can
offer a TNC today at the low-end without being competitive. The KPC-3
offers features not yet available on the other units.

This is a clear case of "your mileage may vary" -- look carefully at
what everyone has to offer, and look at what each company is doing to
improve their products.

73 -- Lynn

P.S. IMHO, the PK-9612 is an excellent choice.

>73 de ke8tq Fred

Well Fred

We are running at the crazy speed of 1200baud here is OZ. Many of our
links are HF and cause much frustration (300baud). We get abussive
messages from Sysop's claiming that we are needlessly jamming up the
network.

Unfortunately we have little experience with the high speed stuff here
and it is a little expensive to import from the U.S. In the mean time
a lot of would be amateurs are buying a phone modem and playing
internet....

Technology is screaming past us. A small number of people are using
the higher speeds but in general, 1200baud is our only answer...

Cheers..Peter..

From: tdrumm@sparc.isl.net
Message-ID: <47qbo0$9vk@news.isl.net>
Source record: 40610

I've built and installed the TAPR DCD State Machine modification
on my PK-232. I've built another and installed it in a PK-88 but
I'm having some problems. This one will not sync with most
incoming packets. It does sync with some, however. I did some
snooping with a scope and voltmeter and verified that I'm getting
a clock signal on the state machine board and the receive signal
is getting there as well, and behaves as I would expect to changing
the volume on the radio.

I may have damaged either the latch chip or the EPROM. Is there
anyone familiar with the design who can help me isolate the problem?
I could start swapping chips between the two I've built but I don't
want to end up with two that don't work!

Thanks,

Tony - AA0SM

>THANX IN ADVANCE !!!!

>Rich

>jean@si.com

Hello Rich,

I've asked the same question some time ago and got many people to
respond. There is software availeble on the net BUT 99% of them are
based on using a DSP chip on the soundcard. DSP stands for Digital
Sound Processing, and this technologie isn't common used on the
soundcard you usually see.

There are some people working on software right now ,but haven't
finised it yet, that should work with soundcards that are 100%
soundblaster compatible.

But if you look on the several ham pages on the net you will see links
to FTP sides that have software like Cwave. Cwave is a program thats
working with the available 100% soundblaster compatible cards.

I hope that this helps,

erwin

> liked the separate window for each connection feature. Only left it because I
> got a different TNC and Packy only works with 232. You can find it aound on
> various BBS/ftp sites.

Try UltraPak (version2 2.1 and 3.0 are available). It supports up to ten
simultaneous connections, has a built in PBBS, supports YAPP etc., etc.
Both versions are available from the site ftp.demon.co.uk in the directory
/pub/ham with filenames upak21.zip and upak30.zip respectively.
UltraPak will work with just about all TNCs other than the Baycom modems.
Version 4.0 is just a few weeks from release and will be a blockbuster!!
73, Tim.

Have you tried the APRS SIG? There have been a few threads lately discussing the PK 900 but since I don't own one, I didn't read them. To subscribe to the APRS SIG, send mail to listproc@tapr.org and put in the body of the message "subscribe aprssig firstname lastname" (put in your name, of course). Also, there's an archive of the SIG at ftp.tapr.org.

Source record: 40618

cwm3@psu.edu (Charles McMullen) writes:

>Anybody have or know of info on homebrewing 9600 baud modems for packet?

The modem is the easy part, it's the radio link that is the hard part.
Probably the most bang for the buck would be to buy a commercial
modem from PacComm or Kantronics, and then spend your hobby
hours making the radio work. Making the radio work entails a nice
wide 455 kHz filter and maybe something better than a quadrature
detector, say a real discriminator. Then there's the modulation issue.

You can't homebrew a modem for twice the price of a commercial, so
unless you're coming up with a new signalling scheme it really isn't
worth it.

It should be the best, after all, it changes version numbers at
least 4 times a month.

The newer Windows packet programs are giving the old DOS
based Gold program some pretty good competition.

I still have a version 7 in my junk box waiting for a bug fix to
allow it to work. I can't sell it or give it away though, as they
burned my callsign into it. Sorta like buying a camera that
only the original owner can use...

: an AX.25 link layer for Linux? I haven't researched what this involves

Yep. Kernels in the 1.3.x series come with the AX.25 code and when you do
a "make config" it will ask you if you want it installed. It's also available
as a patch for other kernels. Note also that 1.3.x are "experimental" kernels
and thus may be less stable than 1.2.x. I just compiled 1.3.37 with no
problems so far, except that now I have some terminal trouble such that
less and vi don't work. Probably fixable.

You need to also get the AX.25 tools (I forget the URL) package which
includes the utilities you need to configure a TNC as a "device" and
use it to do useful things (equivalents of telnet, ftp, etc.) As far
as I've seen so far it doesn't seem to re-use the actual ftp and telnet
programs but rather duplicates them. But I haven't actually used it
yet so I might be mistaken...

So which one have you ACTUALLY tried and know work and works well.
Give the guy a specific recommendation based on experience not just
your opinion. I have a KPC9612 AND I have a MFJ 1270 AND I have a
Pacom. Both the Kantronics and the Pacom work great. The MFJ/TNC2
clones are fine for ancient 1200 baud but the 9600 baud with the
plug-in (you have to solder also) modem is a total kludge. The KPC9612
was almost plug and play 9600 baud and it does both for less than the
price of the MFJ1270+9600 baud modem. I believe Pacom is "semi" TNC2
compatible. Basically it's a "work-a-like" but won't run TNC2 firmware
unmodified as I have been told. Speak with facts. What specifically to
you recommend because I'd be interested as well.

Packet radio in the CB. I'm not sure it is 100% legal, but somehow it seems
authorities allow the use of the CB for this. The call sigs you mentioned
are all made up and used to satisfy the software.

Greetings,

Feico de Boer

:
: Alex,
: 97.113 Prohibited transmissions.
: (d) No station shall transmit: ...messages in code or ciphers where
: the intent is to obscure the meaning (except where specifically
: excepted elsewhere in this Part)...

Where does that say encryption? All that rule is concerned about is 'obscuring the meaning'. Usually that's what encryption is used for, but if there was an encryption method that made the transmission more efficient, and your intention was not to obscure the meaning, and it would probably help to give out the keys to decrypt your transmissions, then running encryption is legal. The FCC pretty much could care less what you run and how you run it, as long and you're not 'obscuring the meaning' and trying to prevent others from receiving your transmissions.

Also where does the poster mention running it over ham radio? Ever think that there are folks running packet radio software and protocols outside of the ham bands? I'm sure the person is well aware of any possible rule violations, no reason to incorrectly recite rules though when the reason for the question is not known.

: Encryption is illegal on any amateur radio frequency with the following
: exceptions:

If I wanted to compress a file to send over packet, and I found that it didn't compress very good in plain text, but when I ran it though rot13 and it compressed better, and I told people that it was rot13 and compressed, is that legal? Sure it is. The intention was to get better compression to be more efficient on the transmission. rot13 may not be much of an example for encryption (it's just character rotation), but it does fit the example.

I'm not saying though that people should try to come up with reasons for running encryption, all I'm stating is that folks need to get their facts straight before judging for themselves what the rules are.

Hi Dave.

I am currently running a 241a with a KPC3...very easy to interface, and I can help you with that, however, I went one step further. I added a DB-9 socket to the rear of the radio, for data. I got the audio from the discriminator, hence, can set the 'volume knob' where ever I want (TNC ALWAYS gets the right signal). Additionally, I can leave my mic hooked up all the time.

Let me know if you need the info.

>you recommend because I'd be interested as well.

The old MFJ1270 (and the original TAPR TNC2) need to have the opamp
used as a RS232 serial converter changed to a TL084 when used at
faster speeds. Otherwise, they work fine. The PacComm Tiny 2 is
100% firmware compatible with a TAPR TNC2 (or direct clone), and
is 100% hardware compatible at the modem disconnect level (it does
use a real RS232 converter and doesn't need the opamp change
needed by true TAPR (and MFJ) units). For better performance,
you may want to go to Z80H parts and a faster processor clock
on any of these (factory option from PacComm).

As Brian said, Kantronics is proprietary and isn't firmware or
hardware compatible with third party products. This can be a
limitation down the road. However, the KPC-3 is a good basic
1200 baud TNC, and the 9612 is a functional dual speed TNC.
If you don't mind being tied to one vendor for possible upgrades,
either will do fine for plug and play. But if you might need to

use one for a TheNet node, or to drive a really high performance
modem such as the 56kb RF modem, then you're hosed. (There are
better ways to drive a 56kb modem, but you *can* use a TNC2
clone, you can't use the Kantronics because it won't accept
the KISS56 firmware and you'd have to do serious hacking and
cutting to do the hardware interface.)

An AX25 driver is part of the regular Linux distribution. There's
no reason to use JNOS unless you want the BBS functions. Otherwise
it's a horrible kludge when you could be using kernel services
instead.

Mini-Circuits SBL-1 mixers work up to 500MHz OK. +7dBm local oscillator
power, IF down to DC, conversion loss 7dB max. They are relatively cheap
as well.

Source record: 40634

Greetings Packeteers:

Anyone else had this problem?

I get messages from my ham buddies in Missouri fine. When I send them messages they only get the first line of my messages. Their paths take only 5 transfers to get here to Oregon. My paths from Oregon to Missouri take from 11 to 50!

I have put the message into my bbs and then read the message so I know the message is being put into the bbs ok. Who knows why it gets chopped up from there? Do You?

Also anybody know if AEA PK232 will run clover mode??

Thanks,

Michael, KG0RS

Mini Circuits Labs has an entire assortment of mixers, including
the SBL-1, and TUF-x (smaller, my preference) mixers, and QPSK
modulators, and VCOs, etc. They now have a much smaller, concentrated
catalog that they'll send you for free.

4899. Need Mods For Icom IC-736

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-09 00:00:00 UTC
From: yingst@knighted.com
Message-ID: <47u3dc$les@crier.knighted.com>
Source record: 40636

Does anyone have any mods for the ICOM IC-736? I'm looking for a way to
turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna). I'm also looking for a way to
improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.
With the notch filter ON the audio sounds a little better,
but it still could use some improvement.
They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).
I had a IC-737 that had the same problem with the audio,
just not sounding quite right. I am also interested in any other mods
for the Icom IC-736. Please send any replies to yingst@knighted.com Note:
If you post a reply into this newsgroup I proably wont get it,
my internet provider only holds news for 1 day. Thank You. Harry

jimbo@panix.com (James C. Brost) wrote:

> Can a mac be used to receive and send CW. Any MAC software available.

I know of no Mac apps to directly control a CW station (i.e., "key" the transmitter in response to keyboard input and display the ASCII received Morse code stream). Having implemented these capabilities on other (antiquated) platforms, I was disappointed when I discovered how difficult it would be to do so on the Mac. The difficulties are twofold: (1) getting direct control of two I/O pins (input/output) on the serial port and (2) doing low-level timing of received Morse elements (dots/dashes). Both of these were insignificant issues when I wrote a CW application for my antique $50 TI-99/4A "home computer" (read: toy).

I'm sure that there are TNCs available commercially that will provide a simple serial interface to any computer (Macs, PCs, whatever) to control a CW station, but I don't have a pointer for you. I've thought about 'porting my stuff to a dedicated, cheap processor like the PIC to create a cheap "CW-only" TNC, but time (as ever) seems to be scarce.

There _are_ several "Morse code practice" applications for the Mac that help you learn the code or improve your copy speed; my favorite is

ftp://mirrors.aol.com/pub/info-mac/app/morse-trainer-111-us.hqx [127K]

I have two of the TEKK KS900L (Micro) radios running. They work well
and are quite inexpensive. The negatives are the low power <3 watts
and the RX sensitivity is nearly as good as TEKK claims (only about .7
uvolts vs the .35 TEKK claims). The "Mini" requires mods to work well
at 9600 so it doesn't seem to make much sense. I use a KPC9612 for the
TNC but will soon upgrade to the Kantronics Data engine. I run all
this under Linux.

4902. TCPIP in the Netherlands

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-09 00:00:00 UTC
From: mikemiller@dsm1.dsmnet.com
Message-ID: <47sgma$23f@dsm6.dsmnet.com>
Source record: 40639

Someone uploaded a port of JNOS for the Commodore Amiga to the Amiga software archives. In the port, some of the scripts included references to using TCPIP on 27.145 MHZ in the Netherlands. The domain.txt showed some pretty intricate networks setup in Northwestern Europe on 11 meters.

The question arises as to the actual allocation of 11 meters in Northwestern Europe. In using wireless nets in the Netherlands, some of the people of setup pseudo-callsigns using prefixes such as NL0AAA, etc. which would seem to be an American amateur call allocated to the Pacific region.

Does anyone know what service is allocated freqs. around 27.145 mhz in Europe, especially now that the European Union should probably have primary allocation authority of spectrum following guidelines from the ITU?

The software seems to be complete (with some additions above the most recent AmigaNOS). It does work (or appears to work) properly with my domain.txt, but my curiosity to the 11 meter reference prompts this msg.

>
Well, unfortunately, the U.S.P.S. disagrees with you about the legality and the statistics professors out there at the University of Hawaii will be glad to tell you that chain letters require more people than the population of the earth to succeed more than a few levels.

Here is what the U.S.P.S. has to say:

ftp://garbo.uwasa.fi/pc/docs-net/chain.txt:

" FROM THE UNITED STATES POSTMASTER GENERAL:

Chain Letters

A chain letter is a "get rich quick" scheme that promises that your mail box will soon be stuffed full of cash if you decide to participate. You're

told you can make thousands of dollars every month if you follow the detailed instructions in the letter.

A typical chain letter includes names and addresses of several individuals whom you may or may not know. You are instructed to send a certain amount of money--usually $5--to the person at the top of the list, and then eliminate that name and add yours to the bottom. You are then instructed to mail copies of the letter to a few more individuals who will hopefully repeat the entire process. The letter promises that if they follow the same procedure, your name will gradually move to the top of the list and you'll receive money -- lots of it.

There's at least one problem with chain letters. They're illegal if they request money or other items of value and promise a substantial return to the participants. Chain letters are a form of gambling, and sending them through the mail (or delivering them in person or by computer, but mailing money to participate) violates Title 18, United States Code, Section 1302, the Postal Lottery Statute. (Chain letters that ask for items of minor value, like picture postcards or recipes, are may be mailed, since such items are not things of value within the meaning of the law.)

Recently, high-tech chain letters have begun surfacing. They may be disseminated over the Internet, or may require the copying and mailing of computer disks rather than paper. Regardless of what technology is used to advance the scheme, if the mail is used at any step along the way, it is still illegal.

The main thing to remember is that a chain letter is simply a bad investment. You certainly won't get rich. You will receive little or no money. The few dollars you may get will probably not be as much as you spend making and mailing copies of the chain letter.

Chain letters don't work because the promise that all participants in a chain letter will be winners is mathematically impossible. Also, many people participate, but do not send money to the person at the top of the list. Some others create a chain letter that lists their name numerous times--in various forms with different addressee. So, in reality, all the money in a chain is going to one person.

Do not be fooled if the chain letter is used to sell inexpensive reports on credit, mail order sales, mailing lists, or other topics. The primary purpose is to take your money, not to sell information. "Selling" a prod-

uct does not ensure legality. Be doubly suspicious if there's a claim that
the U.S. Postal Service or U.S. Postal Inspection Service has declared the
letter legal. This is said only to mislead you. Neither the Postal Service
nor Postal Inspectors give prior approval to any chain letter.

Participating in a chain letter is a losing proposition. Turn over any chain letter you receive that asks for money or other items of value to your local postmaster or nearest Postal Inspector. Write on the mailing envelope of the letter or in a separate transmittal letter, "I received this in the mail and believe it may be illegal."

Well that is one thing I really like about packet. I can enjoy
packet with my entire family without having to worry about the
language that sometimes appears in the newsgroups and mail-lists
on "THE NET". I agree that most of the messages have content that
isn't worth the time it takes to read but then there are some
very intelligent people out there too. You just have to find
them and start a conversation. Most of them are so tickled to
find someone to convers with intelligently that they kick right
into it.

The Weather Service radio stations are starting to broadcast packets of digital data as part of their broadcasts. I asked about this, and got pointed to a company, Dataradio, which sells the equipment to generate and receive the signals. They sell a receiver for $535, which is a bit higher than a Radio Shack WeatherCube :-) that outputs to a parallel printer port or to RS-232 serial. Sez on their brochure that the broadcast uses 5100 nominal baud, and VSK (VSK? what's that?) modulation.

[...]
>I can't comment on FlexNet since it isn't used here -- it may be that it
>simply has better default settings.

Since FlexNet seems to be pretty unknown outside europe, I'll elaborate
a little bit on it.
In my opinion the FlexNet system is *PERFECT*.
The base of FlexNet was to choose HOP-TO-HOP AX.25-L2 digipeating. If
I have a connection to another station, let's say my partner is on the
same port of the flexnet node as I am (to keep it easy). If I send an
info frame via the digi then as soon as the digi receives it it *directly*
acks the frame and forwards the contained data to the other station.
You may call this a protocol or even layer model violation on one hand,
but on the other hand the result is that it works *VERY* fast and with
only few protocol overhead.
The other thing is the autorouter. it works just great, too. It may not
always find the fastest route (it usually does) but the route it finds
is stable. You don't have to play with a lot of parameters, just enter
you link partner and the rest is done automatically. To check the link
quality flexnet checks the round trip time to the neighbour periodically
and updates the nodes routing table and if neccessary sends a route update
to the neigbours. There's no unreliable broadcasting.
The fact that you don't have to use the netrom protocol as layer 3 protocol
you save some protocol overhead when using tcp/ip and you're able to set
your MTU to very high values, for example my standart MTU is 1296, which
means that usually AX.25 fragmentation is used which saves - again -
protocol overhead.

At last let me say that we got both - netrom and flexnet systems in germany,
the netrom nodes mainly in the northern part of the country and I saw
both systems in action. believe me, NETROM is simply a MESS compared
with flex.
Unfortunately (?) I have nearly no experience with ROSE, so I can't say
anything about that.

Hope I was able to tell you some useful news.

Organization: NETCOM On-line Communication Services (408 261-4700 guest)
Summary:
Keywords:
HELLO FELLOW HAMS:and FUTURE HAMS !!!!!!!

HAM BBS dedicated to amateur radio !!!!

There is a DEVOTED AMATEUR RADIO BBS in town ,from your
ARRL/LAX affiliated club coordinator , JOE CIRA , KB6AXK ....
Everything and anything about AMATEUR RADIO will be found here,
IF NOT ? Let me know and we will post it and file it !!!!!!!!

HAM*INFO*LINK*SOURCE BBS at 1-818-584-1952....
24 hrs,8-n-1,anyspeed.......
running 486/66 with 2.1 gig of space !!!
cd/rom's soon and TNC/PACKET DOOR IS UP & RUNNING !!!
qsl route database,clubs,newsletters,bulletins,shareware,utility
mods,programs,test ques,lists,and more....
VEC/VE exam & class list for all So.Cal.
sample exam tests and answers for all class's..
ARRL mirror of all there files !
Using Wildcat v4.11 software..
easy to log in and no FEE's it's FREE !
5,475 FILES IN 115 FILE AREA'S..so far !
GOOD NEWS THE LANDLINE TO HAM PACKET DOOR IS UP AND RUNNING*******
ARE YOU ON THE HAM USERS LIST ???????

73's & 88's de kb6axk,joe cira,ARRL/LAX/ACC.
INTERNET E-MAIL ADDRESS:> kb6axk@netcom.com

: >Probably the most bang for the buck would be to buy a commercial
: >modem from PacComm or Kantronics, and then spend your hobby
: >hours making the radio work. Making the radio work entails a nice
: >wide 455 kHz filter and maybe something better than a quadrature
: >detector, say a real discriminator. Then there's the modulation issue.

: >You can't homebrew a modem for twice the price of a commercial, so
: >unless you're coming up with a new signalling scheme it really isn't
: >worth it.

: What is the price of commercial 9k6 modems in the USA, and what price
: do you calculate for homebrewing?
: At least over here, building a 9k6 modem yourself (or from a kit) is
: still cheaper than the commercial versions. But that may be because
: of the high markups on imported commercial stuff (both tax and profit)

My KPC9612 (both 1200 and 9600 in one full-featured TNC, and you can even
use both baud rates at once!) cost $199. I don't think it gets much
cheaper than that unless you buy used, or have a TNC already and just want
to buy a plug-in 9600 baud modem for it.

I said: "I have a VIC 20 I want to trade for a IC-781" (how long do we have read thesre messages where some ham wants to trade his junk for something woth something).

From: KH2KQ@KA6EYH.#NOCAL.CA.USA.NOAM
To : K1OIK@KQ1K.MA.USA.NA

Hello Burt,

You actually got one of those VIC-20's you wanna trade?

I do not have a Icom 781, but I does have a Kenwood 950SDX - howsa bout dat?

Only problem is dat it am attached under the counter of a 36 foot motorhome. So if youse trade for da 950 youse gotta take the motorhome too. Its got a generator and only 123 actual miles. But the problem der is dat it am havin a dead battery and it can't start and it is in the driveway of my vacation home at the beach in Malibu - so youse also gotta take the house in Malibu if youse want the 950SDX.

Howsomever, there is a beach bunny and her girlfriend that said they would just die if I sold the Malibu house on the beach, so they come with the house and the motorhome and the radio.

If dat am OK, then weese got a deal!

Oh yeah, does the VIC-20 got a DC power supply with it?

By the by, if you hear of anyone who has a Kenwood TS-50 attached to a Mercedes 450SLC - I would like to trade a Radio Shack 202 for it!!!!!!!

73 de Chuck

4918. What some think about sexy hams

The following messages were sent to me by a ham that is afraid to be identified beacuse of the torment most of you will put him through for having a different opinion. But it is how most young peeple feel (that is why they quit the hobby or never get in it). But you can keep thinking whatever you want and let ham radio die. Some say I send flames but I am not the author of below. I get lots of support and many messages like the ones that follow.

From: xxxxx@.xxxxcom
To: k1oik@ccsnet.com
Subject: You hate good news.
Date: Fri, 15 Sep 95 03:42:54

they like threats. they thrive off of it. i don't agree with everything you have said, burt. however, you are right on about several issues... one of them being the burping, farting, pants sagging in the crotch from too many handhelds on a waist that can't support them... i may carry a handheld, cellphone, and a pager all at once, but at least i'm not so out of shape that i have my pants sagging like they have a load in them. i stay somewhat in touch with reality... i liked the rabbit story. it made a pretty damn good statement... that's why they don't respond. many of them know that to take away code would allow intelligent people, people with more intelligence <gasp> than they are, into their little good ol' boys club.

no, not all hams that learn code are like what you described, only about i estimate 85-90% are like that, drooling with 10 handhelds on their belts looking like they're on some sort of mind-altering substance (too much rf overloading of the brain tissue). my group of friends and i all dress like we're the nightclub crowd for the underground scene... leather jackets with studs, some of us have half shaved heads (i'm probably one of the few that look almost normal), nocturnal, hang out on numerous 440 and commercial band repeaters, play paintball, get (raise eyebrows) exercise (i ride my bike at least 10 miles every other day), play sports once in a while, i love snow skiing, and take plenty of time out of the radios to go to the movies, spend time with my girlfriend (who just happens to like listening to the scanners with me once in a while to all the fire and pd activity), go camping, party...

seeing "young" punks like myself enter into the hobby bothers the oldtimer whiners and complainers on the local 2-meter boxes and the old fart elitist jerks that hang out on simplex on 144.245 around the valley

here, badmouthing everyone and everything that stumble across them on their commute home. i think my area has the largest population of INACTIVE currently licensed hams of just about anywhere. many of these people are interested in the "technical" aspects of ham, get their licenses, check into one of the local 2-meter high level boxes, hear all the old farts on all day pissing and moaning about colostomy bags, get dissillusioned and put their gear away in the closet. it's pretty sad.

they're so afraid that their little club will be "polluted" with fresh knowledge and arrogance to their little rituals that they lash out at any attempt to break the mold.

if you want to quote it, go right ahead, on one condition, DO NOT USE MY CALL LETTERS OR NAME OR EMAIL ADDRESS. i agree with the philosophies behind a great deal of your thinking, but i'm not going to put myself in a position where i get jumped on every time i respond or post in the newsgroup. i still find a few redeeming qualities in ham radio, and it is still (though more commercial communications / monitoring) my favorite hobby. i just happen to get exercise, prefer sex with my girlfriend over the radios, and eat somewhat decent food.

again, have fun with the quotes. just don't give me credit for them. i really have enough mail come into my mailbox on a daily basis without having to deal with drivel from some bloated cholesterol-laiden fuck who wants to discuss with me the merits of using a "bug" over a straight-key or trying to tell me how useless satellite communications are.

keep up the good work, burt. you're one of the few reasons i sti still read the newsgroup.

>say "I would like to know YOUR name." A ham says, "What is THE name for
>the log?"

>Burt, K1OIK.

Burt,

If you looked closely at what is being said, you will see that one ham asking another ham's name for the log is entirely different than asking the ham for his or her name.

In the first instance, I am clearly stating as to why I want your name..I do keep a log of my contacts. Also this information can be used for sending QSL cards. All of this is quickly said by asking for your name for the log. However, I guess I could say "I would like to know your name because I am a nice guy,, I am keeping a log, and I might send you a QSL card". Hmmmm, seems a bit to much.

Hams are very personable otherwise you would not have FM voice, AM voice, SSB voice, or even ATV.

ST>It should be the best, after all, it changes version numbers at
>least 4 times a month.

I've been a Registered User of KaGold for over a year...and I feel no such animosity towards Interflex.

If they didn't keep up with hardware manufacturer changes, you'd be screaming at them for that. KaGold isn't laden with bugs or otherwise suffer from "bad code" or anything. The changes are mostly made to "keep up" with changes that Kantronics (and other manufacturers) make in THEIR products.

A major benefit, for example, of v9.03+ is the ability to read not one, but several Callsign CD-ROM databases. And QRZ! changed their data structure between releases of their CD - and Interflex was right on top of the situation, let us know ahead of time that it was upcoming, and had us prepared for the Update.

Interflex is conscientious. They have their end users in mind at all times. I have had nothing but positive experiences when contacting them via fax, e-mail, voice, or on their own Support BBS.

AEA made a PK90 'Commercial' TNC that did some crude encryption. It
said right in the manual though, that the cipher was very simple.

Listen to what the rule says, They don't want any types of ciphers put on any amateur transmissions. That is pretty simple. All that they want is simple plain text transmissions. I think that you had better check on the definition of encryption. It is the same thing as saying, scrambled, enciphered, jammed, etc. There is no excuse to trying to get around the rules of the game, so just follow them and you will be alright.

73,

From: Igor Blakunov <yl2gkb@linux.cs.dpu.lv>
Newsgroups: rec.radio.amateur.misc, rec.radio.amateur.packet
Subject: Help. F6FBB. InterNet forwarding.

Hi !

I am beginner sysop F6FBB BBS.
I want to do forwarding via InterNet.
Simple scheme is:

```
|F6FBB BBS| | PAD | | GATE | |F6FBB BBS|
| PC 386 |----| X.25|----|X.25/IP|- - - - -| with IP |
|Ser. COM | | | | | | |
```

I would like to made following protocol:

1. From my BBS I get access to PAD port (this port on PAD
I can configured as desire) and waiting PAD prompt.
(for example: "SYSTEM>")
2. Then I send network address to connected with GATE X.25/IP
(for example: "210046") and waiting InterNet prompt.
3. Then I send my login, password, and "telnet xxx.xx.xx.xx"
4. Then I send login and password again and connecting to BBS.

My questions are:

1. How I can to get access from F6FBB BBS to remote device
(Asynchronous PAD) and to see its prompt? That must be
single-user cable connection (as RS-232 remote terminal).

2. May be possible to made procedure to automatic realization
my protocol (see above)?

My software:

MSDOS 6.2
F6FBB 5.15
G8BPQ 4.08a

Thank you.

>I want to send small numbers of kilobytes of 8-bit binary data through
>a KPC3 in the most efficient manner.

>It seems to me that if I send binary, some bytes may be interpreted as
>command strings, rather than simply passed on by the TNC. Is this so?

Yes, there are commands for the KPC3 that do permit some data transparency. This is suitable for sending extended character set text, but it is far from being a high-integrity solution to file transfer. If that is what you are looking for, three approaches have been used with three corresponding levels of performance:

Use data transparency on both ends, push the file through, edit the captured data to somehow recreate the original start and end of file - not easy.

Use a simple protocol like YAPP, implemented in many programs, to transfer a file with error detection.

Use an advanced file transfer protocol, that adds imbedded filename recognition, remote-end operation (get file and get directory, in addition to send file), restartability of broken transfers, and simultaneous kb-to-kb chat during file transfer. KaGold from Interflex was the first to offer such an advanced file transfer protocol for the kpc3, and now KaWin offers a fully compatible implementation that adds concurrent file transfers on multiple concurrent connects on the same or multiple TNCs!

Your choice...

[...]
>The Kantronics manual mentions briefly a mode called "Transparent". Is
>this what I am looking for?

Yes. In this mode, it will pass all data without interpreting it.
To use this mode Either set CONMODE TRANS (all connects will be
transparent mode), or connect normally (converse mode), then send ctrl-c
(get cmd: prompt) and enter TRANS. Exit from the transparent mode is only
if the other station disconnects (only if NEWMODE is ON), or you send a
sequence of 3 ctrl-C's within a guard window of 1 second without other
traffic (exactly the same process used with a Hayes-compatible phone modem,
but the Hayes uses plus signs).

It may be possible to move control characters in the converse mode by
prefixing the troublesome ones (ctrl-C, ctrl-M, etc) with the PASS
character (usually ctrl-V). But the transparent mode was really intended
for this.

There is a very old program called YAPP which functions as a simple dumb
terminal and also implements a protocol which does a fairly good job at
moving binary files over packet. It sets the TNC in tranparent mode,
exchanges a header with the file name and length, then lets fly with the
data (letting the AX.25 take care of error checks and acknowledgement). I
think the overhead is either nil or 1 byte per 255.

I'm headed off to Comdex, the huge computer trade show and exposition in Las Vegas NV (Nov 13-Nov 18). I'll be there on behalf of my employer so they get to direct my time for the most part - but given some free time, I'll post some online reports of any neat technology that I run across. I'm hopeful to see some wireless data type systems being demo'd.

Anyway, you'll find the reports (*If* I can get online access and everything works out as hoped) at our free Ham Radio Online virtual magazine. Take a look at http://www.accessone.com/~vbook/hronline.htm (yep, missing the "l" for what are now obscure reasons).

Thanks and enjoy, 73,
Ed, KF7VY

Since Linux 1.3.1 the linux kernel supports AX25.
If you want something more comfortable but not as elegant as that get my
WAMPlus951002.linux.src.tgz package from UCSD.EDU. Me and some others
made the work to rip all TCP stuff out of WAMPES, implement some new
features and the resulting code just does IP routing over AX25 and NETROM.

>enciphered, jammed, etc. There is no excuse to trying to get around the
>rules of the game, so just follow them and you will be alright.

Every amateur 9600 baud modem has a scrambler. It's Ok under the
rules because it isn't being used with the *intent* of obscuring
meaning. That's what the rules prohibit. Any method that *facilitates*
transmission, be it scrambling, compression, interleaving, or bit
stuffing is perfectly legal if its use isn't *intended* to obscure
meaning. The FCC has issued an opinion on this (actually more than
one because amateurs can't seem to get this straight). Scrambling
is used to make sure the data strean has no DC component which
would bias the waveform. It's legal. Interleaving, a transposition
cipher, is legal when used as part of a FEC scheme to mitigate
burst errors. Bit stuffing, a standard cipher trick, is legal
when used to prevent false flag detection. Compression, when
used to facilitate transmission, is legal, though it completely
obscures any plain text.

The use of code books is also legal, if the intent isn't to
obscure meaning. A classic example of a code book is the ARRL
numbered radiograms. But use of code books is not limited to
just that set of messages. Any message set can be placed in
a code book, if the intent is to facilitate transmission, not
to obscure meaning. If you use some method not publicly documented,
you have to keep a copy of the method in your station records,
but that's the only limitation on use of codes or ciphers to
facilitate transmission. OTOH, if you attempt to keep the method
secret with the intent to obscure meaning, then you fall under
the prohibition.

4932. Packet on Solaris 2.3 (SPARC)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-12 00:00:00 UTC
From: hudson@cs.tulane.edu
Message-ID: <485uqd$t9a@rs10.tcs.tulane.edu>
Source record: 40542

Does anyone know of any NOS's available for Solaris? Everything I've
seen has been either MS-DOS or Linux based so far. I made progress
porting TNOS to SVR4, but converting the PC specific function to more
general ones for the SPARC is turning into more work that I care
to deal with right now.

Rather than deal with a BBS/NOS program, why can't I simply drop
the packet users to a standard Unix shell? Are there any simple
ways to go about doing so?

In case it matters, I have a KPC-3 and an MFJ-1274, hooked to
an HTX-202 and Alicon 160-T. The machine in question is a SPARC 1+
running Solaris 2.3 (with the jumbo serial-patch installed).

73 and thanks,
Tramm

When one leaves out the location and purpose (original poster) in a
post, asumptions will be made.

However, the original poster asked about KA9Q, that SW certainly was
written so it could be used in the US even if used elsewhere.

>instead.

Actually AX25 is not a standard feature in the Linux 1.2.X kernel
versions. Perhaps a CDROM or distribution vendor has prepatched things.

AX25 kernel patches and utilities are available for Linux 1.2.X.
you kind of have to hunt around for them and patch things yourself.

If that sounds too hard, Linux 1.3.X (the development series of kernels
now in beta testing for the 1.4 release) has the AX25 and NetROM stuff
already in the kernel, so all you have to do is type 'make' go through
the configuration.

you have to recompile ifconfig, route etc. to take advantage of the
ax25 and netrom stuff. there are some ax25 and netrom specific utilities
and daemons you have to get and compile too, assuming you want to do
more than TCP/IP over AX25 UI frames.

there's some other programs available too: a digipeating daemon, a routing
daemon (RSPF) and some BBS related programs.

best bet is to send mail to majordomo@vger.rutgers.edu and join the
linux-hams mailing list.

I had a friend ask me to replace the hd in their z-180. I researched
the project with several hd suppliers, asked for help on CI$, etc.
The hd in the z-180 was a Panasonic IDE hd with a 25 pin proprietary
interface. Panasonic discontinued the drive, no hd supplier I talked to
could supply it, and Zenith wanted an outragous price for a
refurbished unit.
I advised my friend to scrap the laptop.

Good luck,
jdv (impatiently awaiting my callsign, just passed Tech test. :))

Hey, guys, why was this posted in puzzles, running, skiing, and half a dozen other groups? Ham related I can understand, but PLEASE look at the cross-posted groups!

BTW, I picked this up in rec.running, but I always wanted the name also--and of course I wrote it IN the log (where else, back in the old pre-computer days?) 73. N6IM

: Ham operator Jokes:

Hi Burt! I really miss your *perspective* on amateur radio over there on
the RIME network.

: 1. What is the thinnest book in the world?
: What hams know about women.

I heard "Italian War Heroes" myself.

: 2. How does a ham take a bubble bath?
: He eats beans for dinner.

Yeah, I heard "How does a redneck take a......"

: 3. What's a ham's idea of foreplay?
: A half hour of contesting.

I heard "Brace yourself Martha"

: 4. How can you tell if a ham is sexually excited?
: If he's still breathing.

This one is very old......

: 5. How many hams does it take to change a roll of toilet paper?
: We don't know...it has never happened.

The version I head was "Men" and not just hams.

: 6. What's a ham's idea of helping with the housework?
: Lifting his leg so you can vacuum.

Once again, I had heard "men"

: 7. What does a ham consider a seven course meal?
: A hot dog and a six pack of beer.

Once again, I had heard "men".

Burt, you're gonna have to do a little better than this!

Cheers!

Andy

I took a couple years off from hamming and now that I'm back, I find PACTOR. I gather from the name it's a cross between packet and AMTOR, and I am hearing signals on HF that sound like AMTOR only with longer packet lengths, so I presume that's PACTOR...

Oh, and I cannot decode these signals.

What do I need to do to my PAKRATT232 in order to run PACTOR? Where can I find general information on the net concerning this new format?

Alex,
97.113 Prohibited transmissions.
(d) No station shall transmit: ...messages in code or ciphers where
the intent is to obscure the meaning (except where specifically
excepted elsewhere in this Part)...

Encryption is illegal on any amateur radio frequency with the following
exceptions:
Telecommand control links to amateur spacecraft (satellites)

97.211(b)
A telecommand station may transmit special codes intended to obscure
the meaning of telecommand messages to the station in space operation.

That is the only exception.

Sorry OM.

I did however just notice that your address is not in the United States
so the rules may not apply to you. However, it the transmission does
enter the United States part 97 would apply here.

AEA made a PK90 'Commercial' TNC that did some crude encryption. It
said right in the manual though, that the cipher was very simple.

What is the price of commercial 9k6 modems in the USA, and what price
do you calculate for homebrewing?
At least over here, building a 9k6 modem yourself (or from a kit) is
still cheaper than the commercial versions. But that may be because
of the high markups on imported commercial stuff (both tax and profit)

Well that is one thing I really like about packet. I can enjoy
packet with my entire family without having to worry about the
language that sometimes appears in the newsgroups and mail-lists
on "THE NET". I agree that most of the messages have content that
isn't worth the time it takes to read but then there are some
very intelligent people out there too. You just have to find
them and start a conversation. Most of them are so tickled to
find someone to convers with intelligently that they kick right
into it.

ST>It should be the best, after all, it changes version numbers at
>least 4 times a month.

I've been a Registered User of KaGold for over a year...and I feel no
such animosity towards Interflex.

If they didn't keep up with hardware manufacturer changes, you'd be
screaming at them for that. KaGold isn't laden with bugs or otherwise
suffer from "bad code" or anything. The changes are mostly made to
"keep up" with changes that Kantronics (and other manufacturers) make
in THEIR products.

A major benefit, for example, of v9.03+ is the ability to read not one,
but several Callsign CD-ROM databases. And QRZ! changed their data
structure between releases of their CD - and Interflex was right on top
of the situation, let us know ahead of time that it was upcoming, and
had us prepared for the Update.

Interflex is conscientious. They have their end users in mind at all
times. I have had nothing but positive experiences when contacting them
via fax, e-mail, voice, or on their own Support BBS.

>Rich

>jean@si.com

Hello Rich,

I've asked the same question some time ago and got many people to
respond. There is software availeble on the net BUT 99% of them are
based on using a DSP chip on the soundcard. DSP stands for Digital
Sound Processing, and this technologie isn't common used on the
soundcard you usually see.

There are some people working on software right now ,but haven't
finised it yet, that should work with soundcards that are 100%
soundblaster compatible.

But if you look on the several ham pages on the net you will see links
to FTP sides that have software like Cwave. Cwave is a program thats
working with the available 100% soundblaster compatible cards.

I hope that this helps,

erwin

From: mikemiller@dsm1.dsmnet.com
Subject: TCPIP in the Netherlands

Someone uploaded a port of JNOS for the Commodore Amiga to the Amiga
software archives. In the port, some of the scripts included references
to using TCPIP on 27.145 MHZ in the Netherlands. The domain.txt showed
some pretty intricate networks setup in Northwestern Europe on 11 meters.

The question arises as to the actual allocation of 11 meters in Northwestern
Europe. In using wireless nets in the Netherlands, some of the people of
setup pseudo-callsigns using prefixes such as NL0AAA, etc. which would

seem to be an American amateur call allocated to the Pacific region.

Does anyone know what service is allocated freqs. around 27.145 mhz in
Europe, especially now that the European Union should probably have
primary allocation authority of spectrum following guidelines from the
ITU?

The software seems to be complete (with some additions above the most
recent AmigaNOS). It does work (or appears to work) properly with my
domain.txt, but my curiosity to the 11 meter reference prompts this msg.

11 meters is CB, it is not related to amateur radio service.
those guys have no assigned callsigns, and can use whatever they like.
they usually do not know about callsign conventions in the amateur
network, so they re-use callsigns that would be allocated to other countries
when taken as amateur callsigns.

this is unfortunate, yes. but there is little that can be done about it.
I have suggested someone to at least use a callsign convention that is
easily recognizable as not being amateur-radio (like 3 letters+3 digits)
but it turns out that some software they want to use makes checks on
"valid callsigns" that would fail in that case.

>Does anyone know what service is allocated freqs. around 27.145 mhz in

The use of CB on these frequencies is legal in most of Europe.
Not all countries allow packet radio, but the Netherlands does.

I have two of the TEKK KS900L (Micro) radios running. They work well
and are quite inexpensive. The negatives are the low power <3 watts
and the RX sensitivity is nearly as good as TEKK claims (only about .7
uvolts vs the .35 TEKK claims). The "Mini" requires mods to work well
at 9600 so it doesn't seem to make much sense. I use a KPC9612 for the
TNC but will soon upgrade to the Kantronics Data engine. I run all
this under Linux.

From: pete@grfn.org (Pete Hoffswell)
Subject: Using Digital Modes for ARES operations?

We are currently using ARESDATA for our our ARES operations, keeping
data on casulties, and providing some communications between varous
emergency command centers.

This program leaves much to be desired, in both user interface, and use of bandwidth.

I am looking for any alternative ARES Digital implementations that any of you folks are doing out there!

If you are using digital modes in your emergency operations, please respond, and let me know what and how you are doing it.

I am currently evaluating APRS for this task as well. APRS will be very nice for managing the APRS locations of APRS members, and other things, but does not really have a way to manage a casulties database.

Any ideas?

: be appreciated.

Hi Brian ...

I have a bunch of friends in S. America I talk (via messages) with
regularly. I have some friends that winter on their sailboats in the
Carribean (dogs that they are). I myself camp about 80 days a year.
When in a campground 300 miles from home, I don't have Internet access.
In fact, canoe camping in the Algonquin Provintial Park in Ontario
insures that I won't have Internet access. Yet I can talk to all my
friends at home ... and my BBS.

You are correct Charlie.

>Oh, and I cannot decode these signals.

>What do I need to do to my PAKRATT232 in order to run PACTOR? Where
>can I find general information on the net concerning this new format?

Charlie you can call AEA and get the PACTOR updated PROMS and install
into your PK232MBX. They will explain all to you. You then need
appropriate software to decode the PACTOR. Again you can get
PC-PACKRATT II from AEA which will decode PACTOR fine business. You
can also get a copy of LAN-LINK version 2.32 from many BBS systems
which has the capability to decode PACTOR.

Hope this helps. Bill/W5BBR

It is. Might be G-tor or even clover but 95% of the time it is Pactor. What you need to do is get a more recent TNC, or do what I did - order the new roms from AEA for your TNC.

>simple plain text transmissions. I think that you had better check on
>the definition of encryption. It is the same thing as saying, scrambled,
>enciphered, jammed, etc. There is no excuse to trying to get around the
>rules of the game, so just follow them and you will be alright.

N>73,
>Phil N5QCN

Phil,

Actually, the rule says that codes and ciphers are prohibited when the
__intent__ is to obscure the meaning of the transmission.

If the __intent__ is not to obscure meaning (such as compressing a file
before transmission) then it is not a violation of the "codes and
ciphers" section of the rules.

4957. FBB with KPC2?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-12 00:00:00 UTC
From: ki7mh@delphi.com
Message-ID: <9511120005591.The_Win-D.ki7mh@delphi.com>
Source record: 40690

Hello.
Having trouble running FBB 5.15c with a KPC2.
Seems that once the bbs has one incoming connect (Regardless of source)
that it will reject any others. However, any number of outgoing connects
(BBS intitiated) can exist without effecting this. It appears
to be a problem with the KPC2, it seems.
We are running ESS to put the KPC2 into kiss mode.
Does anyone know of any work arounds to this?

All right, All right...

The man asked a simple technical question about encrypting a radio link.
He figured Hams knew a lot about radio.

All he got was a bunch of Washington legalese/mumbo jumbo.

If you can't help him with the technical side, that is no reason to jump into
your rule book and start pontificating erroniously.

This thread is now terminated, as it has completely deteriorated into
blithering froth on the corner of the mouth...

Oh, I see, the self-righteous calling the self-righteous self-righteous.

I've only been an amateur radio operator for 18 years and I would have to agree with some of the observations. But amateur radio is not the people who participate, but the act of participating. Yes there are some bad apples, but in most activities which concentrate a group of individuals with a specific activity, such as talking to each other on the radio, this is bound to happen. Unfortunately, we are not all as perfect as we should or could be, but I didn't get into amateur radio to join some perfect elite group, I got in because I found being able to communicate over thousands of miles, with a make shift antenna and a relatively inexpensive radio, pretty cool. Other people probably got in for other reasons. Sadly, I think a vast majority of amateur radio operators don't even know what the FCC part 97 reason for amateur radio's existence is.

Don't let the bad apples spoil the excitement that can be found in amateur radio, there is something there for everyone (wives/girlfriends too).

4977. UO-22 still in service?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-13 00:00:00 UTC
From: esvsy@csv.warwick.ac.uk
Message-ID: <487c1s$bj7@comfrey.csv.warwick.ac.uk>
Source record: 40564

I recently got a old packet radio set which send/receive message via the microsatellite Uo-22.

In the mean time, I try to set it up to do some communication. But, I get some trouble in the tracking part.

The only software I use to autotrack the satellite position is so called 'SAT-PC'
Some parameter (Keplerian elements) have to key in in advance in order to setup the software probably.

However, I cannot obtain any signal from the satellite (UO-22) according to the data got from the SAT-PC.

Can anyone tell me whether the satellite UO-22 still in service? or
Anyone can give a set updated Keplerian elements:
1. Sat: UO-22 (in my case)
2. Epoch year
3. Epoch day
4. Date of the set
5. Inclination
6. RA of node
7. Eccentricity
8. Arg. of perigee
9. mean anomaly
10. mean motion
11. decay rate
12. Epoch rev.

Please advise more as I am very new in this area.

many thanks!!

Daniel

NET/ROM does that only for plain AX25 PID $F0 frames. Flexnet can do this
for *any* AX25 frame (Ok, the AX25 adress header is .

This is where a Level 3 would be useful. But not in the node, if I understand
the ISO layer scheme right, the BBS and Cluster have to support layer 3!

Thank god that the sources for NET/ROM are available... I thought that this
was one of the main features ;-)
SO what do we learn from this? Critical software like node software is better
not distributed in source. In Germany we have currently 5 major versions
of TheNet (compatible to NETROM), all more or less incompatible.

This does not mean that distribution of software in general is a bad idea.
You can have sources of applications using the PC/Flexnet application API
but you cannot have the sources of PC/Flexnet. So you are able to use
the router and AX25 software in own projects without needing the source.

There are still lots of problems to be solved (i.e. the hierachical router,
IP router, optimised channel access algorithms like OPTIMA).
So maybe we should concentrate on these things.

I'm getting into the packet radio thing and have a few newbie questions related to throughput and stuff like that:

- What kind of overall throughput can one expect with different flavors of packet radio? With a 1200 baud connection to the local TCP/IP user port I got about 12 bytes/second on file transfers. Some portion of the 1200 baud channel is lost, but where?

- What kind of delay is there when routing packets from TNC to TNC? For example, a local hub in Rochester, NY uses two back-to-back TNC's to connect two Hexipus's. A Hexipus is a diode matrix used to connect up to 6 radio/TNC's. The setup looks something like this:

Hexipus 1 <--> TNC1 <--> TNC2 <--> Hexipus 2

Isn't this going to kill throughput on connections that go between the two hexipus's?

- What else is involved in getting decent throughput in packet? Are there different considerations between user ports and backbones?

Try getting on Texnet, which is a backbone across Texas (and a few other states). It can (usually) be reached from anywhere in the Dallas metroplex on 145.05 by issuing a `c TEXNET' command. Once connected, try connecting to NDABBS ( ` C NDALNK @ NDALLAS ') for a start. If you are on the NDALLAS node, you must digipeat through the node rather than connect through the network.

Hope this helps!

Yes, but TheNET/NetROM also REQUIRES an end-to-end acknowledgement, which gums it all up again.
(However, your points about it being many different implementations, by many different authors, is quite valid - it truly IS amazing that it even works at all!!)

From: sem2r@galen.med.Virginia.EDU
Message-ID: <DI00Gr.2tE@murdoch.acc.Virginia.EDU>
Source record: 40574

I'm looking for a source, preferrably mail order,
for a multiple serial port add-on expansion card for an
IBM-type PC. Importantly, the card should allow flexibility in
IRQ settings so that COM1/3 and COM2/4 don't have the same
IRQ's, rendering it impossible to use them simultaneously.
I'd like to be able to add 3 serial ports, for a total of four
in my computer.

Thanks for the help.

Alexander,
You should also mention that, while the source code for the FlexNet kernel is
not distributed, the source for all applications and channel drivers IS
available, and is distributed as part of the developer's kit. Flexnet is
highly modular in nature: one side deals with live users and other data
sources (like BBSs and such), the other side deals with the RF equipment, and
sitting in the middle is FlexNet. The interfaces to the kernel are very well
documented and defined, so writing a new application or driver is trivial for a
good programmer.
So, those out there that want to do their own thing, still can with FlexNet!
\73,
Don N2IRZ

1200 bits/sec is the same, and only the protocol overhead makes up the
differences. Very small percentages, really...

12 bytes/sec = 96 bits/sec. Add in a few more bits for overhead. the rest is
getting lost WAITING FOR THE CHANNEL TO BE CLEAR !! You send 1200 baud, then
you wait for the other radio's TXDelay, then you wait for the ACK. it all adds
up... Then, add in the other isers, and you get 12 bytes/sec...

A few milliseconds, at most. The Hexipus 'dogbone' doesn't take much more time
than a direct connection.

Your BEST option would be to UPgrade from Solaris 2.3 to Solaris 1.1.1
and get the AX.25 drivers for SunOS. Alternatively, you could port
that code to Slowlaris. I'll leave a copy at ftp.cluon.com in
/pub/ax25.tar.gz. I have this software installed and it works
flawlessly.

It may be true that when one leaves out the location, an erroneous
assumption is more likely. However, what makes you think that this is
one of those cases? Is your knowledge of the net so substandard that
you don't know that '.lv' stands for "Latvia"? Is your knowledge of
world-geography insufficient to give the hint that "Riga" is the
capital of that country?

Why do you have an amateur radio license ?

It seems a lot of radio amateurs take the easy way in making international connectivity. Why not use ithe amateur shortwave bands ? Or the PacSat amateur satellite's ?

Please try to imagine what the future of amateur radio is going to be if everybody goes the internet road. Answer : none

Ok, by posting this reply here i'm also making myself guilty. But i just want to emphasize that there are many interesting subjects for experimentation by radio amateurs, which can very well fill in the need for datacommunication at large distances.

High bitrate / low baudrate modems for shortwave, for example. Or meteor trail scattering techniques.

Remember: we are in first place radio amateurs. And if we don't use our spectral resources, the commercial cellular operators surely will..

Jim,
VERY GOOD QUESTION and
welcome to the world of radio snail mail :->

I'm sorry to say that I dont have a answer for you except for
expect it to be slow....
If you are used to landline modem speeds then you will never be happy with
radio packet until you geta 56K modem :->

There could be several reasons why your thruput is down
How many users on the ports
how many other users on the same frequency
how busy is the frequency
are you getting a lot of nak's / retries
how many port and digi's are you going thru ?
every one of the above will reduce your thruput GREATLY

BAD BAD BAD STUFF...

I hate to say it but
I sold my radio and tnc and put that money where the speed is
I now have a internet account :->

I do have two TNC's and a couple of radios just sitting there
The only things there are used for is the fun stuff
like trying to connect to the MIR space station
and connecting to the space shuttle

From: chrnadig@iiic.ethz.ch
Message-ID: <48aala$qno@neptune.ethz.ch>
Source record: 40492

Hi,

I'm new to Ham and have therefor some questions before I buy my equipement.

Basically I want to connect two computers via a packet radio link (perhaps
with use of existing digipeters). These machines run under UNIX and I'd like
to use PPP as it already exists (I don't want to implement some AX.25 routing
in my kernel). Are there possibilities to establish a transparent connection
with two TNC like normal phone modems do?
Which TNC and which firmware is able to do this? What modem and tranceiver
should be used to achieve a good transfer rate?

Thanks a lot for every hint,
Cheers, Chris

>Basically I want to connect two computers via a packet radio link (perhaps
>with use of existing digipeters).

Existing digipeaters are probably 1.2 kbps. You will not like the performance.
But if your application does not require a high rate of data (say email and
such), then it would work.

>These machines run under UNIX and I'd like
>to use PPP as it already exists (I don't want to implement some AX.25 routing
>in my kernel). Are there possibilities to establish a transparent connection
>with two TNC like normal phone modems do?

Any of the TNC's on the market have a Transparent mode. You would basically
set up your PPP or SLIP as being connected to a Null Modem. It takes a few
settup entries in the TNC, and then you save all parameters so it will auto-
configure on power up. What you have is a simulated serial cable, using radio.
If you get off on a frequency by yourselves (the two computers) you will find
it acceptable for email and low rate stuff. If you try to do file transfers
or NFS mounts, then I fear you will be dissappointed. One good plan is to buy
dual band radios. Here you can run split frequency full duplex. 1.2 kbps at
full duplex is much faster than the normal half-duplex everyone uses. It even
is good enough for Flight Simulator or other modem games :-)

The alternative is the Spread Spectrum Part-15 stuff. As an example, I picked
up two at a surplus store (about $140 for the pair) but they only have 100 mW
of power. The data rate is significantly higher. These operate at
19.2 kbps full duplex in the 900 MHz band. As companies switch over to
the 3 and 5 GHz bands, these older 900 MHz models hit the surplus stores.
Compared to my Ham stuff running 19.2kbps half duplex across the house,
the throughput increase is quite noticeable.

Stacey,
When I had a internet machine up I uas running
Linux.. I had purchased a 6 port serial
card from BOCA
all ports were able to be set up on different irq's
or SHARE the same irq
The cost of the card was about 90.00
with each 10 pin - db9 or db25 cable costing
about 10 - 15 dollars..
a good price considering what you get....

This card was to support cts/rts but I had problems with it
in that respect..

Anyway I'm currently at work and I dont have the specific information on
the card right now..
IF you need more info the please e-mail me and I'll look for it
TTYL and good luck

: Ron Curry

Listen to the audio from a TEKK when your SINAD meter indicates 12db of
quieting. I believe you will agree that the meter is being fooled. Most
likely this is from higher frequencies that are not there when you
hook up the sinad meter to a normal voice grade radio. I've experimented
and placed a single pole RC filter in front of the sinad meter and
the measurements look close to the spec. I'm not sure how the spec should
be written however, the audio is near full quieting when my meter indicates
12 db sinad and that isn't justified either.

: No. There isn't enough memory left in NET (due to the memory model used).

What do you mean by "support DNS?" Do you mean send DNS query requests
to a DNS server? If so, you betcha. My own copy does this. Look at the
"domain addserver" command.

If you mean act as a server for DNS queries, I don't personally know.
I haven't looked that closely myself -- I use a Linux box for that.

All I know for sure is that there certainly *are* copies of KA9Q NOS
out there that will query DNS.

5003. TNC2 QUESTION

Newsgroup: rec.radio.amateur.digital.misc

Hello,

I am in the process of rebuilding a TAPR TNC2
that was damaged by lightning last summer. I
have all the necessary parts and am in the
process of performing the digital loopback
test. Everything works perfectly until
I get to the step where I install jumper
jmp10 and short pins 4 and 6 of U20. This
is supposed to verify the operation of the
DCD circuitry from a digital point of view.
I should be able to connect to myself and
see the CON LED illuminate. It is not
happening. Again the connects of the
previous steps are working. I was
I am using TNC2 software version 1.1.7b
and the state divice is version 1.09.
The TNC2 software is an update from the
verion originally used when I build
the TNC. Could it be that I am missing
an errata from the update that modifies
this portion of the proceedure?

The troubleshooting section of the book is
not very helpful in this area. Any advice
or suggestions would be appreciated.
Thanks. Dave WA1UWU

5004. WIN '95 RUNS BAYCOM under WINDOWS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-14 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <48b7se$53c@newshost.lanl.gov>
Source record: 40500

Sorry for the caps, but I think this is pretty cool stuff.
I recently upgraded to Windoze '95 and like it fine, none of
the bugs so many people seem to complain about. NOW I like it
even more, I just plugged in an ancient homebrew modem and
opened my BAYCOM software first in DOS, then just for fun tried
the same program from a DOS window when I got Windows running
again... it works fine! Is this the only version of Windows
that will allow BAYCOM to run in a window without having to
kill Windows altogether?
Even as I type this in one window via Netscape, my Baycom is
merrily running in an adjacent window and the screen is
updating each time a packet is received, srolling right along
like it was designed that way.
My system is a Gateway 2000 Pentium P5-120, 32K RAM, 1 gig HD.
Looks like of a sudden I'm going to be more active on packet
since I now can run it in the background under win '95 !!

Source record: 40501

If the old equipment you have received is for terrestrial packet it will not work with the 9600 baud pacsats. The use of the pacsats is quite complicated and not possible to address in a short post I would strongly recommend that you contact AMSAT/GB or the University of Surrey for local expert advise. E-mail to amsat/gb@amsat.org might work or perhaps one of the area coordinators in the UK can take you under his wing to get going. UO-22 is alive and well but you need much more than Keplerian elements at this point. Best of luck 73 de Jerry

There are versions of NOS that will answer requests (from the local
cache, forwarding as necessary).

However, they do not follow the RFCs in several areas.

Including things like the cache doesn't time out, negative replies
are cached like positive ones and failures are not properly
distinguished from authoritative no's.

In short, you can use it as a target for other clients, but don't
even think about pointing real connected hosts at it.

5007. BayCom 9600 with PIC ???

>73 de Dave
>crosbyd@gov.on.ca
>VE3VSM @ VA3VSM.#CON.ON.CAN.NA

Reference VE3VSM comments I can only offer the following comments from the AEA operating manual for the PK232; "If you are using the AEA PAKRATT for WINDOWS program, follow the instructions in the program manual to enter the PACTOR mode. The current AEA PAKRATT for DOS does not support PACTOR except in the dumb terminal mode. AEA will have PC PAKRATT for DOS with PACTOR available later in 1993."

I must say that I have to replace the PROM's in my current PK232MBX with the PACTOR PROM's before I can verify this to be true because my memory is not the best. Reason I say that is my TNC was hit by lightening earlier this year and it took out the PROM's for PACTOR and I replaced them with the older version without PACTOR.

Dave I do appreciate your comments and would like to hear more about not needing PACTOR software.

Regards.

Bill, W5BBR

5022. Help Wanted in Using Hamcom 3.0!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-15 00:00:00 UTC
From: megabyte@globalcom.net
Message-ID: <48banj$i1o@head.globalcom.net>
Source record: 40509

I have Hamcomm 3.0 and I have the interface. Just to test I connected only yhe speaker output of my rig to the audio input on the hamcom interface. I ran the program and went to the tunning screen. Nothing happens. In fact, the tunning indicator justs sit on 499Hz no mater what I tune in on my rig or what volume I set the speaker at.

I went through the troubleshooting that comes with the Hamcomm documentation and all seems well.

Can anyone give me some insite as to what may be going on? Perhaps a specific part of the troubleshooting I need to repeat more carefully? Anything would be helpful at this point!!!!

How can i give him a specific recommendation on what to buy when i
don't know which factors are most important to him? Maybe he's a
techie and installation difficulty is not and issue. Or maybe he's
planning on a long path with a poor S/N ratio, if i'd done some BER
testing i might pass those along. Just telling him i used a tnc_1 and
a k9ng and it 'worked great' has little or no value in helping him
determine the best setup for his application. If he is looking for the
best technical solution with the highest reliability just stating 'it
works great' doesn't mean squat.

>The MFJ/TNC2
>clones are fine for ancient 1200 baud but the 9600 baud with the
>plug-in (you have to solder also) modem is a total kludge. The KPC9612

>compatible. Basically it's a "work-a-like" but won't run TNC2 firmware
>unmodified as I have been told. Speak with facts. What specifically to
>you recommend because I'd be interested as well.
>

I'm quiet sure that your analysis of the Kantronics, the MFJ and the
Pacom are nothing more than an opinion as well. They happen to be an
opinion based on some experience, but so what. I know people that have

'experienced' favorable results with a Hugo, but that hardly makes the Hugo design viable. My comments were directed at the design philosophy implemented by Kantronics. The "facts" of which i explained and offered my opinion that it is one of the considerations he should take into account.

BTW: I'm a little surprised the Kantronics 9612 is cost competitive with the tnc2/add-on modem. My tnc2 was $115, the Tapr modem is $70, or I've used k9ng modems which were $25. What is the cost of the KT9612 compared to my $140.00 tnc2/k9ng? I'll admit that my $140 k9ng/tnc2 solution is not suited for all situations. BER comparison testing of this combination would show it to be a compromise. Of course, i use it on a +20db full limiting path so my experience is 'it works great'. Big deal.

If ease of application is a factor then your comment regarding the installation of the various modem designs has some value. On the other hand, it seems to me that future upgrades, adaptability and hardware support should also be considered.

Want some more opinion? Here is one shared by many knowledgable people in the product evaluation field.

Experience is NOT the best teacher when you are talking about product evaluation. We shouldn't ignore the experiences of others but they are only one of the MINOR factors. Especially the positive non-technical reports such as yours. Even if you told me 'in your experience' you had 5 Tnc2's that all blew up, it wouldn't mean crap to me unless you had clearly identified the root cause. The experience in and of itself has little value.

As far as "speaking the facts" goes, your hear-say about the PacCom is incorrect. The PacCom Tiny2 is firmware and modem expansion header compatible.

Another suggestion is to try KaWin software for the Kantronics KAM (if you are so equipped). I use it over here and it is a wonderful little program. I have been communicating with the program's author and have been giving him ideas on ways to make it more useful (such as emulating features supported in KAGOLD and XPCOM/XPKAM/XPDUAL). If you are interested in trying it, use your web browser to connect to the KaWin homepage:

http://www.mutadv.com/kawin

You can download a free trial copy of the software and if you like it, you can pay the registration fee and enjoy it like I did. I have tried several other kinds of software and have found this one to be the most friendly with Windows and the most straightforward to operate.

Dear Packet dudes

I have been playing with packet for a while and have recently started to get involved with tcpip. I have set up ka9q nos and got this working fine.

I am interested though in utilising tcpip through the gateways that are available from the packet world to the internet.

I have telnetted to the gateways and telnetted from there into the internet but have not worked out how to ftp and do other things through the gateways.

What i would particularly like would be to use nos to remotely fetch www pages.

Has anyone done this - how can gateways be used to tcpip directly through?

cheers Peter

I dont have a baycom anymore, but I was able to time-share under
Windows 3.x with a carefully set up .PIF file...worked fine, and I
had it "windowed" as well. I now have a TNC, which of course, can
make you active 100% of the time, with never having to turn your
computer on. :)

5031. 2 day report running BAYCOM w/Win'95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-15 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <48dj21$sun@newshost.lanl.gov>
Source record: 40518

Well, after repairing a broken solder joint on my homebrew
modem, I now have a couple days of baycom use w/Win'95 under my
belt. The baycom window is resizeable, it transmits and
receives fine, and receives stuff in the background while I'm
busy with other apps in the foreground.
HOWEVER, the bad news is that the packet system does NOT
respond nor transmit etc while in "background" mode. If the
baycom window is not in the foreground and the active window,
it will receive and print text to the screen but ignore all
connect requests or polls, etc, if already connected before
being relegated to the background. So if you're trying to
carry on a packet QSO in the background or do a file transfer
over the radio while you do something else it will not work...
if left in the background long enough the other station will
eventually give up and disconnect with a timeout.
Some of you Windoze Whizzes surely may be able to come up with
config settings that would allow it to work better in this
regard.
Still, even with the limitations, it's nice to be able to at
least monitor packet activity in the background... and pop it
to the foreground if I want to actually connect to someone.

>73, de Tim ka8ddz

Might be why you only stayed with it for two months. 1200 hundred baud
on a Baycom is really only a curosity and seriously underwhelming.
Once you've checked out the local bbs's you soon ask "is that all".
It's kind of like computers. You can still buy a used 8088 or 286 and
claim it's a computer but what you can do with it is severely lmited
compared to a 486 or Pentium machine running Win96/NT or Linux.

Saying you tried packet because you used a Baycom is like saying you
have eaten at MacDonalds and have tried restaurants and not found them
to your liking. Probably not the best route for everyone.

Good points Gary but you make the point. Having owned all the TNC's
you mentioned I can say from experience they all required "tweaking"
and "patching" to work - except the Kantronics and the Pacomm. I think
they are both good.

Maybe you "can" use a TNC2 clone with a 56kb RF modem but it makes no
sense considering none of the serial ports on any of them (except for
the Pacomm Spirit and Kantronics DataEngine which aren't really TNC2
compatible except for the disconnect header) go faster than 19200 or
38400. So I don't put much stock in the "upgradeablility" of TNC2

clones. All the TNC's on the market today are ancient technology (except the Spirit and DataEnging which are just "old" technology) and not likely to be too useful for anything higher than 9600 and 19200 in some cases. Anyone going to 56kb will be using a Gracilis card or PI2 - not a z80 based TNC.

The KPC9612 can do 19200 or 9600, with simultaneous 1200 out of the box. I don't think any of the others can do that and especially not for $200. But that's why there are choices.

I typically see ftp rates of 45 - 70 bytes per second, sometimes higher,
on 1200 baud packet TCP/IP. Traffic on the channel, however, has a
dramatic impact (as you might guess) particularly if there is a lot of
AX25 traffic. AX25 is not nearly as "polite" as TCP/IP.

Another factor is TXdelay at either end being set unnecessarily high. I am
running an HTX-202 and our gateway is running a Yaesu FT2500 (the 2500 is
VERY fast) and I can reduce txdelay to less than 20 at both ends,
dramatically increasing throughput.

Source record: 40443

Hello,
I have started looking into how DFSK is implemented with packet radio. As far was I can tell you need a true FM modulated radio(not phase modulated) and the IF bandwidth must be 15khz.
I understand they use a 3khz frequency shift above and below the transmiting frequency of the radio instead of the 2200 and 1200 tones as with AFSK in 1200 buad tncs.
I understand they bypass the audio filters and go directly into the varicap and the discriminator circuit of the radio..and that the PAD sends NRZI encoded data to the modem which modulates it into tones before sending it to the radio..
A'm I correct so far and it there a source where I could find more information on this subject? Possibly a source where I could find information/schematics on the G3RUH 9600 buad modem?

please email me at:
imchief@ix.netcom.com

Like Ron, I have had them all and I hate to "pile on" but I have to add
that the Kantronics KPC3 & KPC1296 documentation is good and the
schematics are very clear.

Also, if you think you can plug any TAPR compatable TNC into any node
stack you are fooling yourself. The various RS232 interface schemes
are not compatable on diode matrix's with several TNC's.

Finally, owners of the PacComm Sprint (don't know about the Spirit) will
disagree on patches required for node use.

5046. CD Creation Station

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-16 00:00:00 UTC
From: soliton1@ix.netcom.com
Message-ID: <48erhb$7fc@ixnews3.ix.netcom.com>
Source record: 40531

CD Create Station - The complete D Recordable System
Hardware and Software for just $8995
(including one year maintenance and support)

Now Available From Soliton Computing, Inc.
(909)307-3377, (909)793-6655, Fax (909)307-3399

CD Create Station is a cross platform CDROM solution which organizes data from your computer and generates standard CDROMs for UNIX, Macintosh and PC users.

CD Creation Station premastering software is the ONLY software which enables you to create Hybrid formatting. Hybrid reserves all formats all data is shared not duplicated. Hybrid CDROMs intergrate PC(ISO9660), Macintosh(HFS) and UNIX (Rockridge) standard formats on a single CDROM.

CD Creation Station is a Plug and Record solution. CD Creation Station comes complete with Premastering software, a networkable controller, and a four speed CD Recorder. Faster recorder, and Kodak 75 disc transporter are also available at no additional software costs.

Premastering software enables you to point and click to transfer your data to conform to accepted CDROM formats. Virtual write is available to allow you to test and manipulate your data image prior to recording. Premastering software is normally loaded into the networkable controller.

CD Creation Station's networkable controller unit rtansfers the premastered image to the CD Recorder. The controller unit virtually guarantees every CDROM. The controller unit allows you to create CDROM from a workstation or directly from a file server. The internal 1 GB SCSI II hard disk will work with the SCSI buffering system to eliminate any buffer under run problem.

The CD Creation Station controller unit's SCSI cable kit connects to your workstation or server via the SCSI II bus. The same bus allows other SCSI devices to be attached.

CD Creation Station allows you to choose the CD Recorder that best fits your needs. It comes standard with Yamaha 4X recorder. All available CD Recorders on the market work with CD Creation Station, like Kodak 6X, Kodak 2X, Philips 2X, and others.

Currently support plateforms:
Sun 4.1.3

Sun Solaris 2.X
SGI Irix 5.2, 5.3, 6.0.
HP/UX 9.X, 10.0X
IBM AIX 2.X, 3.X
Macintosh
Windows 3.1, WFW, W95, NT.

From: loadshed@aol.com
Message-ID: <48g50k$ijm@newsbf02.news.aol.com>
Source record: 40534

I need some advice from some of the more experienced PACKET users on how to get started with the beast. Is there any literature you would recommend to get a hold of to get me going. We currently have a computer set up in our office that hams can access weather data from but I would like to set something up in addition to that to access weather data from individual sites across the state...such as temp/wind direction/speed etc. In addition, I would like to have hams/spotters (storm chasers) be able to use this system to access doppler radar data in addition to be able to call in from anywhere across the state with a severe weather report. Am I dreaming here or is this a realistic goal with PACKET/APRS. Your suggestions would be most helpful.

>Does anyone knoe how to get a 16550 uart to work with baycom packet
>software, with a 8250 uart does it works fine.

Why waste a 16550 on Baycom?? The baycom doesn't use the serial
chip, it just uses two register bits to toggle the bits. Baycom is the
serial chip in software.

Sheesh...

A person really needs a reality check when they're running a baycom on
high dollar computers! Can you imagine some idiot running Win95 and
a Pentium with baycom?? That would be the ultimate in stupidity. It's
like having a 5 year old kid wash your $95k BMW...

Spend a few bucks and buy a TNC, we'll be glad you did (the whole local
network will be glad).

5053. FBB software questions, information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-16 00:00:00 UTC

Message-ID: <9511161556.aa27183@bbs.doruk.com.tr>
Source record: 40538

Is this a good forum for discussion of FBB packet radio BBS software?
I'm a fairly new subscriber and haven't seen much on FBB in here so far.
What I'm interested in particularly is programming for FBB systems,
especially on ways to 'hook' the program while it's executing.

If this isn't the right place, can anyone suggest something similar
and better suited to FBB? I only have email here, so need a digest
or discussion group.

I have an old 8086 computer that still works (!) that I'd like to give to my father as a Christmas present. He is into Ham Radio and thought he'd like to try packet. What other equipment/software do I need to make a packet "system"?

Thanks in advance for the help!

Ken Newbury

>If it is just a matter of a nonstandard connector, I certainly do not
>mind doing a little cutting and splicing. However, judging from the
>quantity of electronics on that adapter board, it must be the former
>option, yes?
The information I was given was that the hard drive had an
proprietary IDE interface. Since Standard IDE uses a 40 pin
interface and this beast only used 25 pins I decided I didn't have
the time or patience (not to mention the hardware) to analyse the
thing and to develop an adaptation that may or may not have worked.
If you decide to tackle it and find a solution that works I would
appreciate you e-mailing me the how-to info. :-)

Good Luck,
jdv

Hello

I'm in the market for a New All Mode TNC. I liked the KAM over the AEA PK-232 and the MFJ. I just have recived this month's QST (Dec.) Opened it up and found something interesting. I noticed that AEA came out with a new TNC Called the DSP 232. I wanted to know if anyone know anything about it and the price. Any info will be a great help!

Environment Canada uses these broadcasts since many years.

The people that run Dataradio are those that demonstrated packet radio in Montreal at a MARC meeting in the 70's. That was before AX25 and TAPR. I still remember that historic evening like it was yesterday.

Hi all,

Just a quickie, I'm planning on going over to 9600 Baud sometime soon, I know I have to buy a radio with a wider bandwidth than a "normal" one. I'm thinking of modifying my current radio (kenwood th-77e) to allow me to do this.

But, I connected the radio to a signal generator, and found that my recieve bandwidth was almost 8K !

Now, assuming I have this capability in transmit mode, whats stopping me just connecting a tnc direct to the ear/mic sockets?....

TIA Max Lock, G7UOZ...

>
>
Of course it depends what modes he may wish to use and what you want to spend. I suggest you go along to your local ham store and check what is availlable there in your price range. For packet alone, you have to remember some will only work on VHF, others will do HF as well. For VHF (and UHF), the Tiny 2 is a good one, For both HF and VHF/UHF - the PK88 is one example. As Bob says the PK232 is an excellent choice, as is the Kam. Both multimodes, which offer a range of modes, like RTTY, Pactor, SSTV, Fax etc etc, are a good bet, but cost considerably more.
Regards,

I received a call today from a ham who would not identify himself. I repeatedly asked him who he was, even saying to him that if he had an opinion worth anything it is reasonable to expect he state who he was. Still he he refused. I then commented that he was "so typical ham, no guts." My wife then told me to get off the phone and stop wasting time with gutless hams who hide behind their mikes. As I made one more effort to identify the caller, he hung up. He also made a veiled threat that bad things would happen to me, I retorted I might take it more seriously if he were not a gutless ham.

This call is just so typical of hams, brave at a distance.

I'd like to add that if you work DX, then Packet might be worth
it for the DX Clusters. I'm very disappointed, especially because
of the availible nodes in my area. I wouldn't work DX without
the Cluster!

5082. G8BPQ/X1J/PacketCluster: Info available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-17 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goDI7n55.Jw8@netcom.com>
Source record: 40469

If you have interest in the use of G8BPQ code into a "NetRom" matrix which uses X1J nodes or equivalent, and in the use of a standalone computer running G8BPQ code connected to a node stack and to a computer running G8BPQ in support of PacketCluster, you may want to obtain a copy of GO-BPQX1.ZIP. This archive is a file I have placed on my ftp site and will be available on DX-BBS (502-898-8864).

My ftp site is netcom.com, then cd to pub/w6/w6go.

73, Jay
w6go@netcom.com

The following is from the summary at the beginning of the document file included in GO-BPQX1.ZIP:

SUMMARY:
========
The W6GO PacketCluster node now has an "X1J node stack" connected to the node via a computer COM port. This gives me much better control of the radio links and also provides a "back door" to the G8BPQ switch in the PacketCluster node. This arrangement also provides a method for getting completely out of the "DRSI business", using only external TNCs for the PacketCluster node (next year's project).

I am now using a second computer hooked to the X1J node stack as a troubleshooting and administrative tool. From that computer I can access distant X1J nodes, capture data from them and make changes to them without using the "Attach" function in PacketCluster. From that second computer I can also access the G8BPQ switch in the PacketCluster node, make changes to it, read and store statistics and tables, and even connect through the G8BPQ switch to radios on DRSI ports and distant nodes reachable via those DRSI ports. All this without even touching the PacketCluster SYSOP terminal.

This document describes the W6GO installation and provides access to information which will allow other SYSOPs to implement the same arrangement, hopefully without the trials and tribulations I went through while learning how to make this work. It was worth it, and I hope this helps you.

5083. Packet on a Commodore 64

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-17 00:00:00 UTC
From: degen1@bnl.gov
Message-ID: <degen1-1711951153580001@degen.rhic.bnl.gov>
Source record: 40470

My son (KB2VMU, age 10) is looking to get on packet with his Commodore 64. I have seen a $50 TNC modem advertised, and sold by several vendors, including MFJ, that plugs into the cassette port, and uses software called "Digicom 64".

- Does this thing work OK?

- Is the software free, or is there a shareware fee?

- Can I find the software on the web? If I do, how do I get it into the Commodore?

- A company that advertises in QST, CQ, etc. called A&A sells this modem in kit form. Is this company any good?

- Would I be better off with a standard TNC, rs232 adapter for the 64, and terminal software? (My son can't afford this right now...)

- Does anyone have an old one of these that they would like to sell?

>Any other combination would be desireable. Thanks. E-Mail
>SESAT.IX@NETCOM.COM

Unless I'm very mistaken, such does not exist. I'd suggest however
that joining the DSP-2232 mailing list would be a good thing, as
below.

Reply-To: dsp2232@rmi.de (AEA DSP2232 Mailing List)

I don't recall now which robot is used to handle subscriptions, so I'd
try sending mail to 'dsp2232-request@rmi.de' first, with the word
'subscribe' in the body, first. If not that, send to
'majordomo@rmi.de' and use the all-purpose word 'help' in the message
body to lead you along the way.

I too am interested in other modems for the DSP-2232.

5085. Some know 9600 baud solutions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-18 00:00:00 UTC
From: recurry@insighttec.com
Message-ID: <48jih4$3co@voyager.Internex.NET>
Source record: 40472

Thought I might share my 9600 (and greater) experiences. Here is a
compilation of hardware I've tried:

RADIO TNC MODEM EASE OF CONFIGURATION
(1-10 10 easiest)

TM-733 MFJ1270 MFJ-9600 3 - Modem required
soldering, much tweaking
TM-733 KPC9612 KPC9612 8 - had to make
cables, worked out of box TXdelay 190ms (bad)

FT8500 KPC9612 KPC9612 8 - had to make
cables, worked out of box TXdelay 190ms (bad)

TEKK KS900 KPC9612 KPC9612 7 - had to make cables,
adjustments (TX drive and RX eq.), KPC9612 was EASY to
adjust with only voltmeter. 10ms TXdelay, 80ms w/Mirage D24

TEKK KS900 MFJ1270 TAPR 9600 2 - real experimenters
delight (not because of radio)

MFJ8621 KPC9612 KPC9612 7 - had to make cables,
minor adjust. - easy 20ms TXdelay

D4-10 KPC9612 KPC9612 9 - had to make
cables, plug and play, 10ms

D4-10 Dataengine 19k2/9k6 9 - had to make
cables, plug and play, 10ms 19200 worked out of box over 10mi link

Summary:
The synthesized radios worked. That's about all I can say. The
throughput is TERRIBLE due to the extremely long TXdelays. The only
advantage is their frequency flexibility. The major disadvantage is
they are an EXTREMELY costly solution. THIS IS NOT THE WAY TO GET 9600
baud.

The TEKK KS900 is a cool little radio. Crystal controlled about 3
watts. Spec says .37uv at 12 SNAD. Out of the box they were .65uv and
I could not get any better out of them even with a $20k service
monitor. THESE THINGS WORK GREAT though and only cost about $120
(unless you get them through Pacomm who charges about $60 more). They
can also do 19200 if you mod them. I ended up using a 30 watt amp and
7 element yagi with mine because the link was about 40 miles.

The MFJ8621 is another great deal. Crystal controlled 5 watts about
$110. I have this on an omni for 2m users. Works very well with
several local users at 9600 baud.

The D4-10 is the cream of the crop - also the priciest at around $370 (LIST). This thing is close to commercial quality and worked "plug and play" with the KPC9612 and the Kantronics DataEngine. I'm really impressed with the D4-10. I'm currently using it without modems for a 19200 bps digital voice link experiment (it has digital inputs and outputs).

The KPC9612 is a dual 9600/1200 TNC that can do both simultaneously. It is also capable of 19200 baud with the right radio (I've used it with both a modified TEKK as well as the D4-10 at 19200) The DataEngine is a highpowered TNC with an NEC V40 (80286 class compatible) it is essentially an embedded PC and supposedly can run JNOS standalone. Can do >56kb with right modems and radio. Price - around $390 (LIST).

D4-10+ DataEngine+ (1)DE19k2/9k6 ~$870
D4-10+KPC9612 ~$570
TEKK KS900+KPC9612 ~$320
MFJ8621 + KPC9612 ~$310

These are the list prices for the Kantronics stuff. I'm sure you can get it cheaper.

If performance (and you are not ready for GRAPES) or EASY is a priority then my recommendation for easy 9600 baud is the D4-10 w/DataEngine or KPC9612. My second choice for a less expensive solution is the TEKK(440) or MJF8621(2m) w/the KPC9612.

One of my links is over 40 miles and throught a valley. Using the TEKK radios I had to have an amp. The first amp I tried was an older Mirage 25 40 watt amp with relay T/R switching. The best TXdelay I could get with this amp was about 80ms. With some research the only amp I could find that used PIN diodes for T/R switching was the Mirage D15. This amps works super. I can use TXdelay of <10ms and the link really sings now. Although I have actually measure throughput, perceived response time seems almost as good as a wired 9600 baud modem.

I'm sure there are other solutions. I HAVE ACTUALLY TRIED THESE so this is real world experience. For what it's worth.

>Speaking of HAM radios, could this group help me out? Every time I go and
>dive with my radio set, the fuse blows. What's the trick here?
>

Ah, yes...
There was a time when having a HAM ticket *meant* something...
When a fuse blows consistantly, it's because there's more current going thru the fuse than the fuse is rated to carry. The fuse, being a safety device, blows to prevent this excess current from flowing, possibly damaging something.
Check to make sure the fuse is the proper rating for the gear. Do *not* replace it with a higher-rated fuse! If it is the correct fuse, then the gear is drawing too much current. This needs to be corrected. Maybe it's a short in the power line, maybe the gear is not a boat anchor. Either extreme, and all points in between should be checked, and corrected.
Good luck.
Bill

5087. Hams please read ....

AEA PK232 will operate only one port at a time and does not do GTOR or
Clover modes. It's truly a DSP based version of the PK-232 (low end DSP
chip as far as I can tell).

In my book, the KAM+ is much more flexible and more cost effective.

5092. ROUTES packet utility & other freeware

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-18 00:00:00 UTC
From: "Orrin C. Winton WN1Z" <orrin@redshift.com>
Message-ID: <48jhhk$6ap@wing.redshift.com>
Source record: 40479

A program i've written in C and compiled, a utility i call ROUTES, may be of interest to packet bbs sysops and users, so i am posting this announcement on a couple of the ham newsgroups.

You can also visit my Web page: http://www.redshift.com/~orrin

ROUTES.EXE: A self-extracting archive. For DOS; there is one version for a 50-line screen and one for the 25-line screen. The utility creates a searchable listing, using packet bulletins you have downloaded off your local ham radio BBS using the 'rh' command (rather than 'r') to get the long-header info. The equivalent FBB command is 'v'. The listing will tell you who forwards to whom, who receives from whom. Will also tell you how many days a message stayed on a BBS en route. You can then search the listing with the search program provided, and it will produce a file based on a search callsign you provide.

Sysops might use this program to keep track of forwarding delays over time; 'users' might use this program to keep track of sysops over time :-)

Someone will say that this information could also be gleaned by simple inspection of the routing headers; however, the program ALSO PRODUCES a comma-delimited file (with all forwarding info, not just a single search-callsign) which can be imported into dBase, Paradox, etc. for very versatile sorts and searches. Find bottlenecks between BBSs with corresponding dates and length of 'holds' or delays. In a dBase IV file i made with the results of the program, i sorted on BBS-a, BBS-b, and date, and got a listing showing a history by date of delays in forwarding from a to b, hundreds of 'pairs' of BBSs. The utility will not of course tell you anything about a message which never got to you. For the latter, you need witchcraft and a big stick :-) not C code.

Most of my motivation for writing this utility was that i wanted to come up with a tool for users to try to demystify the forwarding system; some sysops are not always forthcoming with information, and some are not even up-front about their editorial and censorship policies. So this utility is an intelligence-gathering tool for the user. It can also be a tool for the sysop, of course.

Sysops who are not "downloading" messages on the air, with routing headers, but who rather wish to analyze messages sitting on their hard disk, might be able to create one large

file with all the messages combined into one file, by doing the following dos command: copy *.* packet.txt ; my utility requires that there be a text file called 'packet.txt' to work on (a sample is included with my utility); i've used file sizes up to 800K without my utility coughing and dying on me; don't know how big the 'packet.txt' file can get before it would cough and die. Perhaps never, since the text file is examined line by line and only a few hundred bytes are held in memory at any given moment.

An earlier version of this program appeared in May 1995 on the CD-ROM "The World of Ham Radio" by Amsoft. However, the version of ROUTES on the CD does not include the comma-delim file feature mentioned above.

I'm offering some other original freeware, such as (1) curve-fitting regression package (stats) for amateur radio (and other) programmers (how to get an equation to fit a curve in some engineering handbook); (2) rhombic antenna design hf/vhf; a set of 3 programs i call 'fromage' which yank all lines out of Internet email which start with 'From:'. Then you sort the file, kill duplicates with another program of mine, but then you have to go in and clean up the unnecessary garbage like the 'From:' at the beginning and any other junk that came on the line. Eventually i'll get around to combining all these functions into one 'big' utility and include some garbage disposal routines.

Also have some freeware, with C code and author identification material, for several tsr utilities, one of which lets you copy PARTS of your screen (the parts you select) to a disk file, and appends to that disk file every time you invoke the tsr. I use it to reduce 300K listserver downloads to 10K of excerpts. The problem, if it's a problem, is that you have to use a simple DOS text editor like Q-edit; the tsr won't work under Windows, nor in WP for DOS. And 25-line screen only. I just now checked, and it won't work with msdos edit. If you need Q-edit, i think i can send that to you since the signoff blurb makes it look like shareware (you're the one who's responsible for registering your copy), and i'm not SELLING anything in this posting. Apparently the tsr routines are ancient, from the late eighties.

These programs are available at my FTP site (see below), or you could send me a formatted 1.44, 720, or 360 disk (2 360s if you're wanting more than a couple of the utilities), mailer, and enough return postage: Orrin Winton, General Delivery, Monterey CA 93942. If by chance your snailmail bounces, re-mail it to PO Box 89, Big Sur CA 93920. I'm currently a computer science student in Monterey and check my Big Sur box once every two months.

Can also send everything but q-edit as uuencoded binary by
e-mail.

Specify which program(s): ROUTES, STAT, RHOMBIC, FROMAGE, TSR,
and Q-EDIT (for use with the tsr screen copier). Sorry, i can't
put q-edit on an FTP site, it appears to be shareware.

Best regards,

WN1Z Orrin

orrin@redshift.com

I now (11/17/95) have an FTP site for some of this material.

You will find the following files at my FTP site (drop me a note if
the one you're looking for isn't there; i'm trying to improve the
user interfaces on some of the other utilities before i put them in
the ftp site):

110RHOM.EXE) these are zipped self-extracting
ROUTES.EXE) files

Host: redshift.com
Site: /ftp/orrin (or /home/ftp/orrin - i have to clear up this
discrepancy with the SysAdmin)

and if you have files of interest to upload to my site, upload them
to

/ftp/orrin/incoming or /home/ftp/orrin/incoming
whichever works

I think you're looking for a time constant of 75uS (though I thought
120uS is customary for NBFM stuff), which would be 7.5k and .01uF
(7.5e3 * .01e-6 = 75e-6). I usually just use 10k and .01uF for
de-emphasis when I'm not worried about critical accuracy.

[What is an order of magnitude between friends? ;-)]

5096. TAPR-2 Mods ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-18 00:00:00 UTC
From: hduff@humnet.humberc.on.ca
Message-ID: <8167469335902@lss.humnet.humberc.on.ca>
Source record: 40483

I recently aquired a couple of dead TAPR-2 TNC boards that I have been
able to bring to life.
Wondering if someone has a list of mods for these units.

Thanks...Hugh Duff VA3TO

This only possible if you are also a licensed radio amateur.
i use the gateway via n0ary, but you have to register youself over
there befor it works, (and be a radio amateur).

=>even more, I just plugged in an ancient homebrew modem and
=>opened my BAYCOM software first in DOS, then just for fun tried
=>the same program from a DOS window when I got Windows running
=>again... it works fine!
Yes, I tried too and it worked fine. I was using the BAYCOM software ver. 1.50a. The problem now is that I forward messages with my home-bbs using the FBB protocol and the BBS asks me an MD2 password too when I connect it. With TST Host I've got no problem to do these things but TST doesn't work under Windows as BAYCOM does.

I recently heard about a new release of the BAYCOM software. Can someone tell me something about this? Does this new release support these features (MD2 passwd, FBB forwarding, etc)? I wonder if this new version is FTPable somewhere.

=>Looks like of a sudden I'm going to be more active on packet
=>since I now can run it in the background under win '95 !!
Well, it's the same for me. It's not really cool having to close Windows before you can see any packet :^)

Best 73 and thanks in advance for any reply

Well, in general, it is not possible. But if you use one of this fantastic
ham-gates you can connect a ham-bbs and send a message from there into
the ham-network.
A possible gateway is rz3axo.ampr.org (try a telnet-session!)
or use the german gateway db0fho.ampr.org (but ask the sysop for
permission.

5102. Help: Is data transfer possible?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-19 00:00:00 UTC
From: cordero@atm21
Message-ID: <48mbgo$6au@mark.ucdavis.edu>
Source record: 40397

Radio Masters,
I am just a mountain climber and know little of the radio world, but
have heard that transfering digital data is possible via radio.

My goal to to transfer data from my labtop computer in the
South American Andes to an internet provider in Argentina.
Here is my story:
I am on an expedition to climb Mt. Aconcagua, the highest mountain in
the western himisphere(to leave in December).
Our plan was to update our web page from the
mountain using a satellite telephone with data transfer capabilities.
We planned to send not only text, but photos(using digital camera)
and even video. Unfortunately, the satellite network is now
1 year behind scheldule approving data transfer, and we are left
without a means of transfering data from our computer. Is there
a reliable way of transfering data using radio technology?
Would the required equipment be heavy...and would it work in
the mountains? I really don't know anything about it, but if someone
could fill me in, I would be MOST grateful.
Thanks a lot!
Eugene

If it would get those hillbillies to turn off the echo-chambers and
power mikes, then it is good.

The trouble is, someone would see you were having fun and jam
the piss out of it.

Since the FCC has put their head in the sand on 27 MHz (unless
the whole neighborhood is in an uproar) I'd say screw the rules
and have at it. Hell, the FCC is home drinking beer right now while
Clinton picks his hillbilly nose.

Gudday,
I am presently stripping the 3.579545 Burst sig from network T.V. and fine
that some networks are very accurate/stable and several seem to be keyed
to possibly NBS Clock. Has anyone article information as to multiplying
and phase lock looping down to 1mhz or 100khz??

Also an taking Loran 'C' 9960 rep from Nantucket to get prf output of
10040.16064 khz which when multiplied by 249 = 2.5mhz with .000256ppm
'WOW'
Am building comb generator spectrum from 10khz x3 to 30khz then x83
to 2.5mhz thence dividing to 1mhz and 100khz.
Is anyone doing this and does anyone want to experiment with GEN-LOCKED
ham circuit??
Any thoughts appreceiated especially previously written articles.

5112. !Premium Percale Sheets

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-20 00:00:00 UTC
From: taylorm@dcas.com
Message-ID: <48of7b$gmo@ns3.iamerica.net>
Source record: 40399

PREMIUM PERCALE SHEETS

We have located a small manufacturer of percale sheets in Alabama. He uses overruns from the large sheet manufacturers in the area. Overruns are not "second" material, but the amount left on a roll of fabric when a cutting table (50 - 75 yards long) cannot be covered completely. The result is that you get fabrics currently in production and not last year's styles or colors. About 80 % of his production is 180 threads per inch, with most of the rest 200 count and a few 220 count. The fabric is 80% cotton and 20% synthetic.

Each sheet set consists of a top sheet, a fitted bottom sheet and two pillow cases. The price of a KING set is $25.00, a QUEEN set is $22.50, a FULL set is $19.50 and a TWIN set is $17.50. All prices are US currency.

These are excellent sheets - I have used a set for the last 9 months. The fitted sheets will not come off the bed. He has a proprietary method of making a corner that WORKS - It stays tucked under the bed. Also, I have found them quite comfortable.

Sheets are ordered by specifying solids, or light floral or dark floral pattern with a dominant color. About 25% of his production is solid sheets in navy, burgundy, hunter green, slate and a few beige. Orders received by Monday are shipped Wednesday by UPS ground.

In a few weeks you will be able to see all patterns (about 45) which are available on our World Wide Web page and order by the pattern you want. However, in this case, delivery may sometimes take as long as three weeks due to fabric availability.

To order these sheets, please phone us at 318-741-3729 if you do not wish to give your credit card over the Internet. Be sure to specify the size, color, etc., your e-mail address, your mailing address and your phone number.

Shipping and handling is $3.00 US for 1 set and $1.50 US for each additional set within the US.

Please email if you want our WWW location.

Yes, it would be a good idea. But, maybe six new channels above 40
should be made available in 2-channel pairs for packets modulating AM,
FM and FSK.

5115. Packet radio modem with DSP ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-20 00:00:00 UTC
From: fdboer@baan.nl
Message-ID: <DIC49x.A6o@baan.nl>
Source record: 40402

Hello,

Suppose I want to do packet radio and have one modem for different speeds.
The logical way to go seems a DSP, it can be cheap and with the correct
programs it does all you want.

Can someone provide my pointers to DSP hard and software. I prefer http URL's
but ftp will do. I'm looking for both DSP software and hardware.

Thanks,

Feico de Boer

: Dave - WA6TPJ

Most likely the receive buffer is full. This happens when the
MONitor is ON and the computer is turned off. The incoming
data after a while has no place to go and the TNC plays dead.

If your packet program has start-up and end macro capability simply
turn the monitor ON when you start the program (startup macro)
and OFF when you exit the program (end macro). If you need
a program that does this try "paKet". The current version is
6.1.

From: tmsailer@stud.ee.ethz.ch
Message-ID: <48qalb$akh@elna.ethz.ch>
Source record: 40408

```
: This is not true. Baycom uses the interrupts from the UART (which
: is sending dummy bytes) as a timing reference, not a tight CPU loop.
: The timing could be affected by the UART being in FIFO mode.
There are many possibilities implementing the BayCom Receiver. Some
use the DeltaDCD (or another DeltaXXX) interrupt, which is said to be
buggy on some 16550 clones.
Some drivers measure timing by reading the system timer's counting
register instead of using the transmitter as timing reference.
I do not know how the original BayCom software does it. Maybe the
original poster could check other BayCom drivers, as there are many
implementations of BayCom drivers. (TFPCX, TFX, PC/FlexNet, AX25
Packet driver) BTW Baycom dropped their own L2 in favour of PC/FlexNet...

Yes Dave I know the answer. There is a parameter called MONITOR and its
syntax is ON or OFF. With it ON, the TNC will send the recieved data to
the screen. The problem happens when your terminal program is off, and the
built-in 3k "video" buffer fills. Once it has filled, anyone trying to connect
will get a 'busy'. (ever noticed all the data that goes by your screen when
you open your term program? Its that buffer unloading).

All my Kantronics TNCs act this way, but not my MFJs. To fix the problem,
you must turn MONITOR off (M OFF), before shutting down, or, set the connect
string to you mailbox. (this is what I do...it dumps them into my mailbox
wether they connect to my keyboard or not) I run PaKet 6.0, and it allows
startup and shutdown macros....I just put the parameters in there so that
it is automatic.

Hope this helps Dave.

I'm new to the subject, but I just wondered whether anyone has invented a amateur radio gateway onto the WWW.

Can anyone enlighten me?

Robin

5127. Re: Baycom and a 16550 uart ????

It could be that the set-up with the 16550 does not supply enough
voltage to the modem.
I read somewhere that with some computers, you have to add a 9
volt battery to run the modem. The modems used with Baycom get
their power from the serial port. Unfortunately, I can't remember
the details of what I read, as to how you connect the battery.

Changes made since Version 1.0
* Expanded modes, added Baud Summary, References, System Parameters
* added PSK section/Multi-tone section update/RS-ARQ update
* DUP-ARQ-2 added/G-Tor/ARQ-E3 updated/Coquelet updated
* VHF Selcal modes added/ACARS on HF/CROWD36/CIS updated.
* VHF Modes information updated/Artor updated

This Signals FAQ is maintained by Stan Scalsky (sscalsk@atc.ameritel.net).
Any questions, comments or corrections will gladly be accepted. The author
implies no guarantee on this information and does not claim to be an
expert in this field. All information has been gathered from public domain
sources, manufacturers documents, decoder documentation, real time analysis
and any Radio related publication that cares to write about digital signals.
I have tried to research for correctness each mode listed. Many thanks to
those of you who post logs, information and answer stupid questions in the
various forums that cover digital signals - you know who you are.

The decoder manufacturer portion of this document is provided courtesy
of Mike Chace (mikec@praxis.co.uk).

I would like to solicit material, to be included later, on any other
analysis techniques and/or DF techniques the utilities community is
currently using.

* *
A word of Caution: the rules about listening to signals not intended for
you applies here. The contents of many signals might be considered
sensitive by the party sending and the reception of such signals may be

illegal in your country. The authors neither condone or encourage such acts

Section 0 - Introduction

This Signals FAQ is designed to give utility listeners a sampling of the kinds of signals and sounds available on shortwave/vhf radio today along with information on the available equipment needed to understand, analyze or identify these signals.

With conditions being dismal over the last few years coverage of Utility Listening, especially Digital Utilities, has been dropped from most of the main stream shortwave magazines. But in and of itself, Digital Utility listening is inherently more difficult than regular shortwave listening. The possibility of decoding the signal recieved adds another level of complexity. This FAQ is an attempt to let those beginners who are thinking of or wondering what digitial signals can be received and decoded and maybe provide the more advanced listener with a little more information to identify those unknowns.

Here in lies the basic problem with Digital Utility Listening - lack of information. Many systems are used by Military or Diplomatic Services and information on the specifics of a particular mode are impossible to find, even from the manufacturer. Many are considered proprietary, but that doesn't mean that a signal can not be identified! With the proper tools a given signal can be identified via the way it sounds (aurally) or how it looks (visually). Most decoders that include some kind of signal analysis can ID a signal by bit-pattern or baud rate. Many signals have a unique baud, i.e. 300 baud packet, 240 baud HC-ARQ or 164.5/218.3 RUM-FEC. Once a signal is identified there are many decoders that can print the traffic for you but keep in mind various kinds of encryption are commonly found in use with these signals. Encryption types include figure group or letter group messages and even random bit-masking or bitstream encryption, which looks like a continuous stream of random characters.

And now a word about decoders...

There are many kinds of data decoders available ranging from public domain packages to professional dedicated units. Prices vary from free up to very expensive and price is dependent on how much you want to be able to decode and what tools are available for signal analysis and identification. Public domain packages, while good, can not compete with the capability provided by the more expensive dedicated data decoder unit. It is safe to say that price goes up with increased capability in this market - be prepared to spend some big money if you want to cover a lot of modes. A good rule of thumb is that a top-spec decoder will cost as much as a top-spec radio, ie upwards of 2,000 dollars. You'll also need to decide upon whether to buy a stand-alone decoder or one that requires a computer to run. The latter option will of course increase the cost if you don't already possess a machine, but does add flexibility to a decoder. See the Decoders reference for unit specifics on capability and pricing.

What should you look for in a decoder? Some useful features include:

* Signal Identification
* Accurate baud rate measurement
* Correlation Bit Analysis
* Variety in modes decoded/identified
* Ability to save captured text (disk and printer)

You can't beat a good Signal Identification Mode - both the Wavecom units and Hoka units include this option. A good Signal Identification mode simplifies the task of figuring out what mode is currently tuned, but keep

in mind that even the best Identification mode is not always 100% correct. They can be fooled by systems that share common idle characteristics (for example: SWED-ARQ, SITOR-A and TWINPLEX or SITOR-B and POL-ARQ), the presence of interference or a noisy signal. Universal decoders do not include an Identification mode.

Accurate measurement of baud rate is another vital capability. Many modes can be accurately identified on baud rate alone because many rates are unique to a select signal. It also provides the opportunity to "fingerprint" a signal, system or the user. For example, the Hoka decoders can measure baudrate accurately to 3 decimal places. See the Baud Rate Summary Table for further information.

Correlation Bit is a technique that samples the incoming digitized bit stream and presents the data as a graph of bit occurences plotted against time. This will show when patterns occur within a signal giving you another piece of information when working out an unidentified system. This kind of analysis tool can also tell when there are NO patterns to a signal indicating an encrypted or random bit-masked signal, allowing you to move quickly onto more productive signals. Hoka and Wavecom decoders include correlation bit modes.

Mode variety is a personal preference. I would like to have a module for any mode I can receive in the spectrum! While not possible or realistic I will take as many as I can get. I find there is nothing more frustrating than being able to receive a clean signal and then not being able to identify or decode it (ignoring the problem of encrypted signals for the moment). See the manufacturers listing for the modes decoded by various units.

The ability to save decoded output to a file and/or the printer should be considered a very important feature of any decoder. Having some form of hard copy, on disk preferrably, allows for archiving for later reference or later analysis and independant printing and editing. Hoka decoders have the ability to save decoded text to disk or output to the printer. I believe Wavecom units have a similiar ability.

I also like a responsive manufacturer who regularly updates their decoder in line with developments "on the air". Variations on existing systems and completely new systems are still appearing today.

Section 1 - Modes on Shortwave

What modes are currently on shortwave. This section attempts to present a little information about each kind of signal that can be heard within the shortwave spectrum. Signals are grouped together by the way they sound. This is an attempt to narrow the field of possible signals when trying to identify an unknown. The typical baud rate(s) of the signal is mentioned, if known, and any other synonyms or possible names are given. But ... don't make the assumption that these are ALL the modes you will ever hear. There are many signals that remain unidentified.

1-A. SINGLE TONE system.

Yup - still there, didn't know where else to stick this. Can't miss it, very distinctive sound but can it be decoded? Most decoders say they can decode morse but fast machine generated or slow, uneven hand generated morse can be difficult to decode clearly.

CW Morse code still used by the Amateur community and Marine operations. Speed varies depending on whether hand generated or machine generated.

1-B. SYNCHRONOUS DATA BLOCK signals.

Signals of this type generally sound like SITOR-A - a distinctive chirping sound is their main characteristic. Short SWED-ARQ sounds and is exactly like Sitor-A. Idling TWINPLEX is the same as Sitor-A. To identify these signals by ear may be impossible depending on which mode they are currently in and even a decoder that can determine signal type may get confused unless traffic is being sent.

ARQ6-70 6-character-block simplex ARQ using a different alphabet and block timing from ARQ6-90/98.
ARQ6-90/98 6-character-block simplex ARQ used by French and Italian Diplo services, typically 200 bd. ARQ-6/90 and ARQ-6/98 differ in their inter datablock timing.
SWED-ARQ Swedish Adaptive simplex ARQ used by Swedish Diplo services, typically 100 bd. Comes in the 3 packets lengths: short, medium and long. Able to change mid transmission, depending on conditions, giving SWED-ARQ its adaptive capability. Also known as ARQ-SWE.
TWINPLEX 4 frequency diplex system used by Interpol, Danish, Dutch, Pakistani MFAs, Spanish Diplo and UN services, typically 100 200 or 300 bd. This 2 channel system supports several different spacing/shift parameters and word, bit, character or not-interleaved of the channel characters. Reference Table 4-E.
ARTOR Adaptive Robust Transmission Over Radio - an adaptive, error-free mode for HF using QPSK. Typical baud rates are 50, 100 or 200; automatically selected, ARQ and FEC modes are supported.
SITOR-A The most common ARQ signal used by Amateur, Marine and some Gov. Diplo services, typically 100 bd. Also Known as ARQ or TOR.
SI-ARQ Siemens Simplex ARQ used by Austrian and Indonesian Diplo services, typically 96, 144, 192 or 200 bd. Also known as ARQ-S or ARQ-1000-s.
RS-ARQ/ALIS Rohde & Schwarz simplex ARQ used by German and Italian Diplo services, typically 228.7 bd but reports of 457.0 have been noted. Now referred to in Klingenfuss documents as ALIS. The marketing name for this system is MERLIN and is a complete data-over-radio system and can transparently handle many types of data. Con-

sequently it has many modes. The most commonly heard
mode is the 228.7 FSK system and a 7 tone 240 bd burst
ARQ mode. See Klingenfuss Radioteletype Code Manual
13th Ed. for more information.
DUP-ARQ A semi-duplex ARQ system used by Hungarian Diplomatic
services, typically 125 bd. If a DUP-ARQ system detects
interference it will change frequency in 400Hz steps.
If a 3kHz channel is full of interference the system
will select another frequency. Also known as ARTRAC,
ARS-GUARD or 125-ARTRAC.
HC-ARQ Haegelin-Cryptos simplex ARQ used by UN and Red Cross
services, always 240 bd.
IRA-ARQ Duplex ARQ with IRA (ITA-5), used by Czech/Slovak
Diplo stations, typically 171.42, 200.2, or 300.3 bd
PACTOR A system designed with a combination of packet and
sitor techniques used by Amateurs, ICRC, UNO and
MARS stations. The ICRC and UNHCR are the only users
of a different form of pactor - this form, which
modified part of the packet structure for privacy
reasons is commonly referred to as UN-pactor or ICRC-
pactor. A Pactor Level II signal features 2 tones
w/200Hz shift using baud rates of 100 or 200 fitting
into a 500Hz channel. The system can handle raw 8 bit
data and ASCII compression. Depending on band conditions
the data throughput can be increased by changing the
modulation form used: bad conditions start with BPSK
(2-PSK) w/QRG diversity, then D-BPSK without diversity,
then D-QPSK (4-PSK) and finally D-QPSK at 200 baud.
This puts the maximum throughput at 800 bits/sec.

1-C. PACKET-like signals.

While packet signals are a non-continuous signal much like SITOR-A their
sound is totally different from the regular chirp, chirp sound of SITOR-A.
These signals do not have the regular cadance of SITOR-A but have more of
a long duration burst sound.

PACKET A system used in Amateur Radio and MARS stations,
typically 300 bd on SW. Data is arranged in packets of
up to 256 bytes of 8 bit ASCII data. Each packets con-
tains a 1 byte start flag, 3 byte address field, 1 byte
control field, 0-256 bytes of data, 2 byte CRC and
finally a 1 byte end flag. Packets are transmitted with
no fixed timing. See the latest specification published
by the American Radio Relay League (ARRL) for complete
details on this system. Also known as AX25.
G-TOR Golay Transmission over Radio. An amateur system
developed by the engineers at Kantronics, Inc. G-tor's
main advantage is speed - up to 4 times faster than
pactor. It also incorporates a data-interleaving system
that assists in minimizing the effects of atmospheric

noise and has the ability to fix garbled data. G-tor tries to perform all transmissions at 300 bd but drops to 200 bd if difficulties are encountered and finally to 100 bd. All acknowledgments (ACK's and NAK's) are sent at 100 bd.
CLOVER A system developed by Radio Amateurs and sounds like a "canary" when transmitting. A signal consists of a 1s burst + a long 20s data transmission. Clovers key characteristics are band-width effeciency with high error-corrected data rates. Clover adapts to conditions by constantly monitoring the received signal. Parameters which can affect quality and reliability of the trans-mission such as block data errors, phase dispersion, frequency offset, and signal to noise ration are monitored. Based on this monitoring, Clover determines the best modulation scheme to use. Clover supports the following formats:

format	baud rate
BPSM	4 pulse binary phase 125 baud
QPSM	4 pulse quad phase 250 baud
8PSM	4 pulse 8 phase 375 baud
16PSM	4 pulse 16 phase 375 baud
8P2A	4 pulse 8 phase 2 amplitude 500 baud
16P2A	4 pulse 16 phase 2 amplitude 500 baud

Total band width for all modes is a narrow 500 Hz.

ACARS on HF ACARS, generally a VHF based system used by airplanes and ground stations for passing tech info has been noted on HF as part of a feasibility study. HFDL (High-Frequency Datalink) was being tested in N.A on 13339 kHz using 1200 bd on at least 9 Delta 767's. The system uses PSK modulation and uses an adaptive bit rate to support 300bps to 1800bps. See Monitoring Times 6/95 Plane Talk or Digital Review in WUN 10/95 (V1/10) for more info.

1-D. MULTI-TONE signals.

These signals are distinctive in how they sound. A rapid succesion of tones, almost music-like in quality is their main feature. A sophisticated decoder and a rock steady receiver is needed to process these signals.

PICCOLO British FCO invented multi-tone synchronous system. Main user WAS the British Government but is probably British Military and Australian stations. A 6 tone system (MK6) using ITA2 operated at 50 or 75 baud. A 12 tone system (MK12) using ASCII/ITA5 operated at 110 baud. Both systems can still be found on the air.
COQUELET MK 1 is an asynchronus 13 tone ITA2 system used by

French (possibly abandoned), Belgian military/police
and Austrian stations similiar to Piccolo. MK 2 is
a synchronous 8 tone ITA2 system used by the Algerians.
Typical baud rates of 13.33 and 26.67.
CROWD36 Soviet Piccolo system using 32 tones based on British
Piccolo, CIS diplomatic services and French diplomatic
services are unconfirmed users. Typically found at 40
baud. Also known as CIS Piccolo or URS multitone.
MIL188 An 8 tone (?) MFSK system. Also known as NATO MIL188 or
MFSK188. NOTE: the only known sample of this system is
actually believed to be tt2300b so how this signal
really looks and sounds is unknown.
TT2300b An 8 tone MFSK system manufactured by Thrane & Thrane,
used by British government Air Agencies and the French
government.
LINK 11 A US Military/NATO 40 DPSK synchronous system using 15
tones (1 doppler tone + 14 data + 1 sync tone), the
14 data tones are 4-PSK modulated and spaced every 110
hz. The sync tone is 2-PSK modulated. Typical rates of
1364 b/s or 2250 b/s. This is a ground wave only system
and is also known as "Alligator". Klingenfuss indicates
a baud rate 2400. See also MIL-STD-188-203-1A.
AIRCALL A Racal MFSK 7 tone system.

1-E. FAX-like signals.

These signals are used for transmitting pictures, mostly marine weather
maps over the airwaves and make a distinctive scratch-like sound. Press-FAX
can still be found but with less frequency as Press services continue to
move to satellite.

FAX Weather-FAX and less often Press-FAX
HELLSCHREIBER FAX-like mode used by Chinese Internal Press (still?)
now used infrequently by European amateurs on 80m and
40m.

1-F. SYNCHRONOUS BIT STREAM signals.

These signals are distinctive in sound in that they are continuous and
posess a trilling quality. The sound of an idling signal is slightly
different from a signal actively sending traffic. Many signals idle for
long periods of time and send very little traffic, i.e. ARQ-E, ARQ-E3, or
ARQ-M2. They can be found all over the shortwave spectrum. Other signals
have a short idling phase and move directly into traffic and then terminate,
i.e. POL-ARQ, SITOR-B, RUM-FEC or FEC-A.

ARQ-N A single channel duplex ARQ system used by Italian
Diplo services, typically using 72, 96, 144 or 192 bd.
ARQ-E A very common single channel duplex ARQ system used by
French Military Forces and the German Gov, typically
48, 64, 72, 86, 96, 144 or 192 bd. Also known as
ARQ-1000

ARQ-E3 Another very common single channel duplex ARQ system used by French Military Forces, typically 48, 64, 72, 86, 96, 144 or 192 bd.
ARQ-M2 A multiplex (time division duplex) ARQ w/2 data channels, typically using 87, 96 or 200 bd. Also known as TDM, ARQ-28, TDM-2, TDM-242, TDM-342 or 96-TDM.
ARQ-M4 A multiplex (time division duplex) ARQ w/4 data channels, typically using 87, 96, 192 or 200 bd. Not found much any longer but has been used by Chinese, Vietnamese and Spanish embassies. Also known as ARQ-56, TDM-4, TDM-242, TDM-342 or 192-TDM.
POL-ARQ A single channel duplex ARQ system used by Polish Diplo services, typically at 100 bd. Can be easily confused with Sitor-B.
QAM An ARQ system used by the Chinese, unknown usual bd rates. A sample of this signal is available on the Klingenfuss CD (CD#2/Trk9) or Cassette (Trk37). This is also a label for the modulation technique Quad Phase Shift Keying with Amplitude Modulation (QAM).
RAC-ARQ A Racal simplex ARQ system used by British military stations, typically at 150 or 267 bd. This system is heavily encrypted and permuted to minimize any statistical information and supports selective addressing, variable length messages and an error correcting code able to correct 7 errors in 127 bits. See Klingenfuss Radioteletype Code Manual, 13th Ed for more details.
AUTOSPEC A FEC system used by British coastal stations to communicate with North Sea oil rigs, typically 62.3, 68.5 or 102.7 bd. Also known as Autospec-bauer or Bauer.
SPREAD A FEC system, used by Romanian diplo stations, using the Bauer code used by Autospec, with characters spread over a large time span, designed to reduce burst and fading errors. Typically 68.5, 102.7 or 137 bd. Also known as SPREAD-11, SPREAD-21 or SPREAD-51 depending on data spread in effect.
CIS A single channel duplex system using 11, 14 or 27 bits. CIS-11 is used by Russian meteorological stations, CIS-14 is reported to be used by Russian PTT stations on links to the former republics. Typical baud rates are: CIS-11 - 50, 100, 150, 200 and 300 bd, CIS-14 - 42.1, 47.5, 48, 50, 70.5, 72, 83.3, 84.21, 94.11, 96, 100, 144, 200 and 288 bd, CIS-27 - 50 and 100 bd. CIS-11 is also known as TORG-11. CIS-14 is also known as PARITY14.
DUP-ARQ-2 A synchronous system reported by European monitors, first listed in Klingenfuss 14th Ed. Utility Guide. Very little information available but its speculated that the Norwegian Diplo service is using this mode. Baud rates of 125 and 250 have been reported.

SITOR-B A FEC system used by Marine Information services and
the Amateur Radio community, typically 100 bd. Also
known as FEC or AMTOR.
TORG-10 A Soviet ARQ system used to transmit Meteo data,
typically 100 bd
81-81 Russian/URS Military System mainly 81 bd, pseudo random,
one or two characters, 12 bits, always encrypted. Mainly
a 2 ch system but there is a 40.5bd signal that is a
1 ch variant. Most commonly found baud rates are 36.5,
40.5, 73 and 81.
FEC-A A system used by Turkish and German Press and German
Diplo services, typically 96, 144, 192 or 288 bd.
HNG-FEC A FEC system used by Hungarian Diplo services, typically
100.05 bd. See Klingenfuss RadioTeletype Code Manual
13th Edition for teleprinter alphabet used by this
system.
RUM-FEC A FEC system used by Rumanian Diplo services, typically
164.48 or 218.3 bd. Signals can be encrypted, in the
clear or bit-masked (have been known to use 10, 15, 24
or 31). Had been referred to as SAU-FEC in the past or
ROU-FEC.
SI-FEC A Siemens FEC system used by Austrian and Indonesian
Diplo services, typically 96, 192 or 200 bd. Also
known as FEC-S or FEC1000 Simplex.
IRA-ARQ An ARQ system used by the Bulgarian Diplo services,
typically 75, 100, 110, 150, 180, 200, 240, 300 or
600 bd

1-G. ASYNCHRONOUS BIT STREAM signals.

These signals sound like the continuous bit stream signals but with a subtle
cadence difference to them. They are most often encountered sending traffic.

BAUDOT A common signal used by the Amateur community, many
military and government services, typically 50, 75 or
100 bd. Inversion is possible but not frequently
encountered on the data bits, giving 2^5 (32) possible
arrangements. Also known as RTTY or ITA2.
LINK 4 Military encrypted Baudot, typically 75 baud. Also
known as "Beaver".
ASCII A rarely found signal used by the amateur community
typically 110, or 300 bd. Also known as ITA5 or IRA.

1-H. MULTI-CHANNEL/BUZZSAW like signals.

These signals are obnoxious in the way they sound. They have a very harsh
buzz-like quality. Tough to decode because many signals can be transmitted
together and even interleaved. Signal Diversity is often used - defined as
all channels sending the same traffic but shifted in frequency and shifted
in time. The receiving equipment combines the channels into a single channel
if 'X' channels agree. Many times the channels are encrypted. A spectrum
analyzer can be a great help in identifying the signal arrangement.

VFT A general term used to define many kinds of multi-
channel signals used by British Military, Canadian
Military and US Military. Many configurations are
possible.
6028 6028 Series Diversity is a commonly found VFT system
using 16 channels of 50 bd or 75 bd baudot each with
170 Hz shift used by US and Canadian Military.
MULCAST A system used by the US Military composed of 16
channels each with an 85 Hz shift.

1-I. SSTV - Slow Scan TV.

A picture transmition mode developed and used by the Amateur community. While these signals are FAX-like in function they do not possess the scratching quality of the FAX signal. The sound of an SSTV signal is more tonal in its composition, I do not believe that each mode can be distinguished by ear.

SSTV modes

SSTV: AVT 24 120/128 Color 24 sec. Wraase 24 128/128 Color 24 sec.
AVT 90 240/256 Color 90 sec. Wraase 48 256/128 Color 48 sec.

1-J Phase Shift Keying systems

Nearly all of the systems that we have outlined above use Frequency Shift Keying (FSK) of one, two or more tones. However, there are many signals to be heard on HF which are Phase modulated (Phase Shift Keying or PSK) in nature. At present, only the Hoka Code30 is capable of demodulating such signals, and as such, this area of "listening" remains a somewhat uncharted area, and none of the systems known about so far have names like the ones we use above!

However, Hoka's Code 30 provides a tool-set that allows the user to determine the characteristics of a PSK system with little more effort than an FSK-based one. This at least allows us ordinary mortals to "fingerprint" certain types of system. In a nutshell, here are the commonly encountered PSK-based systems;

2-4MHz region: Navigational aids sending Differential Global
Positioning System (DGPS) information using 250bps 4-phase
(or Quarternary) PSK (QPSK). Try 2834.0, 2805.0, 3226.0kHz

3-13MHz region: Unknown users and system sending 1280bps
data using an 4-phase, Offset QPSK scheme. These stations are
recognisable in that they are all placed on .081 offsets from a
kilohertz or half kilohertz point. At least 20 channels are known
to be in almost constant use. Try 9058.081, 7663.581, 5752.081,
and 13369.081kHz amongst others.

5-20MHz region: Unknown user and system sending 600bps data using
2-phase, or Binary PSK. Try 10662.8kHz. 1200bps and 2400bps signals
of a similiar nature have been found in this region also.

---

2. Modes on VHF.

2-A. VHF Pager Signals.

There are data signals on VHF, currently dominated by pager systems. This
area will continue to grow over time as more capability is added to existing
systems.

ACARS Aircraft Communication and Reporting System. A packet-
like 2400 bps PSK digital air to ground system for
passing plane data and messages.

Check the following frequencies in AM mode for signals.
131.550 (US primary)
130.025 (US secondary)
129.125 (US tertiary)
131.475 (Air Canada proprietary channel)
131.725 (Europe primary)
131.450 (Japan primary)

ERMES One of the first pager protocols developed by the
European Telecommunications Standards Institute
between 1986 and 1992.
POCSAG Post Office Code Standardization Advisory Group
Pager system used to transmit telephone numbers
and short text messages. Supports baud rates
of 512 baud and Super-POCSAG supporting 1200
and 2400 baud. Check frequencies around 140.0 MHz
to 146 MHz in FM Narrow for signals.
GOLAY Golay Sequential Pager Signalling System. A Pager
system used to transmit text messages. This is
a Motorola proprietary system. Supports baud rates
of 300 or 600. Check frequencies around 140.0 MHz to
146 MHz in FM Narrow for signals.
APOC Advanced Pager Operating Code. A new mode, developed
by Philips Telecom and announced in 1993, that offers
higher speed and some new features while retaining
backwards compatibility with POCSAG. Supports bit
rates between 1200 to 6400 or about 1200 to 3200 baud
using 2-PAM/FM or 4-PAM/FM modulation.
RAMP Radio Mail Protocol. A two-way pager protocol built

to be backwardly compatible with APOC. Currently
under development by Philips Telecom.
PACKET Amateur system same as HF but typically running
at 1200 baud. Check the HAM bands for this mode.
FMS-BOS Funkmeldesystem fur Behorden und Organisationen mit
Sicherheitsaufgaben loosely translated as Radio
Calling/Communications System for Authorities and
Organizations with Security Concerns. Supports a
baud rate of 1200.
FLEX Paging protocol introduced by Motorola late in 1994.
Supports baud rates of 1600, 3200 and 6400bps.
GSC Motorola proprietary paging protocol.
INFOCALL Supports a baud rate of 1200.
ATIS Supports a baud rate of 1200.
NEC/D3

* POCSAG and GOLAY can also be found on U.S. domestic C/Ku-band Satellite
SCPC carriers.

2-B. VHF SELCAL Signals.

SELCAL systems supported by various European and United States
organizations. Tones supported are listed in the following as
digit/frequency in Hz.

European Systems

+ EEA - SELCAL system conforming to Electronic Engineering Association,
United Kingdom. recommendations. Tones supported 0/1981 1/1124
2/1197 3/1275 4/1358 5/1446 6/1540 7/1640 8/1747 9/1860
+ CCIR 1 - CCIR 1 recommendations from Comite Consultatif International
De Radio.
+ CCIR 7 - SELCAL system conforming to CCIR 7 recommendations from
Comite Consultatif International De Radio.
+ ZVEI 1 - SELCAL system conforming to ZVEI 1 recommendations from
Zentralverband der Electrotechnischen Industrie, West Germany.
+ ZVEI 2 - SELCAL system conforming to ZVEI 2 recommendations from
Zentralverband der Electrotechnischen Industrie, West Germany.
+ NATEL - SELCAL system conforming to Scandinavian National Telephone
(NATEL) recommendations. Tones supported 0/1633 1/631 2/697
3/770 4/852 5/941 6/1040 7/1209 8/1336 9/1477
Eurosignal - Tones supported 0/979.8 1/903.1 2/832.5 3/767.4 4/707.4
5/652.0 6/601.0 7/554.0 8/510.7 9/470.8

Motorola Systems

+ EIA - SELCAL system conforming to Electronics Industries Association,
United States (EIA) recommendations. Tones supported 0/600 1/741
2/882 3/1023 4/1164 5/1305 6/1446 7/1587 8/1728 9/1869
MODAT - Tones supported 0/637.5 1/787.5 2/937.5 3/1087.5 4/1237.5
5/1387.5 6/1537.5 7/1687.5 8/1837.5 9/1987.5

REACH 11th root of 2

High Freq - 0/2400 1/2253 2/2116 3/1987 4/1865 5/1751 6/1644 7/1544
8/1450 9/1361
Low Freq - 0/1200 1/1127 2/1058 3/993 4/933 5/876 6/822 7/772
8/725 9/681

+ ANNEX 10 Aeronautical Regulations 4.8
+ CCITT SELCAL system conforming to CCITT recommendations
+ EURO SELCAL system conforming to EURO recommendations
+ VDEW SELCAL system conforming to VDEW recommendations

+ Hoka Code 30 can decode but needs the VHF option (extra) to decode
these modes.

Section 3. Baud Rate Summary Table

Below is a table of expected baud rates you can most likely encounter for
the latest listing of modes available. An accurate baud rate is a valuable
tool to identifying a particular mode and there are many modes that have
unique baud rates. As of this writing the Hoka and Wavecom units seem to
have the most accurate capability of all existing decoders currently on
the market.

All rates are in units baud except where marked b/s - bits per second.

Section 4. System Parameters

This section lists the unique characteristics of each named mode: specifying character length and known alphabet for all modes. For synchronous data block systems, block length, cycle specifics and baud rate is listed. For sychronous bit stream systems, cycle information and character specifics, such as sync bits, parity bits and interleaving details are listed. Finally for the MFSK systems, tones, tone layout and tone spacing are listed.

Notes on Alphabets - Table 4-F
---

o ITA5 can be referred to as IRA
o ITA5 is the ASCII alphabet and consists of 128 characters, controls,
specials, numbers, lower case letters and upper case letters. This
is an 8 bit alphabet (sometimes includes a 9th bit for parity).
o ITA2P is 5 bit ITA2 converted to 7. A character is composed of
1 sync bit + 5 bit ITA2 char + parity. Sync bit is always 1 (except for
idle and RQ), parity is odd.
o 16 bit alphabet 0 is a 16 bit alphabet, used only by RUM-FEC
16 bit alphabet 1 is a 16 bit alphabet mod 10, used only by RUM-FEC
o BAUER is a 10 bit alphabet, used by AUTOSPEC and SPREAD

o These alphabets are based on ITA2, a 5 bit alphabet.
Cyrillic M2
Hebrew
Arabic Bagdad 70
Arabic Bagdad 80 or ATU-80
Cyrillic 3rd shift M2
3rd shift Greek

3rd shift Korean
3rd shift Amharic
3rd shift Thai

o 3rd shift Japanese is a 6 element code and uses start and stop signals. It cannot be printed on standard teletype equipment.

Klingenfuss Radioteletype Code Manual, 13th Edition

Section 5. What decoders are available.

Specifically this section covers the following data decoders:

Unit	Manufacturer
M400, M900-VF, M1200, M8000	Universal
Code 3, Code 30	Hoka
W4010, W4050, W4100	Wavecom
Air Master, Mode Master	Lowe
MCL 1100	Momentum Communications
ERA Microreader	ERA
AEA PK-232MBX	Advanced Electronic Applications
Hamcomm, JVFax	Public Domain

This list covers the most capable decoders currently available down to those that provide a few of the most common modes. There are probably many other fine units out there not covered in this document. If you come across a unit, from anywhere, and would like to see it included here send us some specifics via e-mail. Each section following provides a description, synopsis, modes decoded, analysis tools included and a UK/US supplier (if known) along with pricing (which is subject to change).

5-A. Universal Decoders

Decoder: Universal M400 (version 2)

Description: Entry level decoder for Beginners

Synopsis: An easy-to-use decoder with most of the common modes
found on both VHF, UHF and HF. Doesn't include CW
(morse) which is somewhat surprising.
Self-contained unit with a two line LCD display
providing for 40 characters of text, there is also
an 8000 character scrollable buffer which holds
incoming text for review later. Housed in metal
case. Universal Radio also supply an IBM computer
control and text display option called the CI-400
costing around USD100.

Modes Decoded: Baudot RTTY 45, 50, 57, 75, 100 Baud
Baudot RTTY 60, 66, 75, 100, 132 WPM
SITOR-A
SITOR-B
ASCII (ITA-5/IRA) 75, 110, 150 Baud
FEC-A 96, 144 Baud
FAX 120 LPM, 576 IOC
POCSAG
GOLAY
ACARS
DTMF 16 digits
CTCSS (PL) 41 standard tones
DCS (DPL) 104 standard codes

Analysis Tools: LED Indicators for Mark, Space, Input and Data

Extras Required: Graphics compatible parallel printer (for FAX)

Supplier: (US) Universal Radio, 6830 Americana Parkway,
Reynoldsburg, Ohio, OH 43068, USA Tel: 614 866 4267

(UK) Martin Lynch, 140-142 Northfield Avenue,
Ealing, London, W13 9SB, United Kingdom
Tel: +44 181 566 1120

Approx. Price: (US) USD400
(UK) GBP400 (Power Supply GBP20)

Decoder: Universal M900-VF (version 2)

Discription: Entry level decoder for Beginners

Synopsis: Easy to use decoder that covers all the main HF
data modes. Basically an M400 unit without the VHF
stuff and without the self contained display. This
one does cover CW (Morse) though.

Modes Decoded: Baudot RTTY 45, 50, 75 Baud
Baudot RTTY 60, 66, 100 WPM
CW 6 to 35 WPM (auto speed determination)
SITOR-A
SITOR-B
FEC-A 96, 144 Baud
FAX 60, 120, 240 LPM,
288 or 576 IOC

Analysis Tools: LED Indicators for Mark, Space, Error, Data,
Squelch, and Limiter. User controls for
Normal/Reverse tones, Squelch setting, Change Case,
Shift Up, Shift Down and Unshift on Space (UOS).

Extras Required: Video Monitor (mono, composite video)
Graphics compatible parallel printer (for hard copy)

12V DC Power Supply

Supplier: (US) Universal Radio, 6830 Americana Parkway,
Reynoldsburg, Ohio, OH 43068, USA Tel: 614 866 4267

(UK) Martin Lynch, 140-142 Northfield Avenue,
Ealing, London, W13 9SB, United Kingdom
Tel: +44 181 566 1120

Approx. Price: (US) USD500
(UK) GBP530 (Power Supply GBP20)

Decoder: Universal M1200

Level: Intermediate-level decoder for HF and VHF systems

Synopsis: This decoder is comes on a full-size PC card to be
inserted into an IBM compatible machine. The
control software is supplied on a 3.5 inch PC
diskette. Comprehensive on-screen status information
and basic diagnostics are included.

Modes Decoded: Baudot RTTY 20 to 250 Baud, auto speed determination
CW 5 to 90 WPM, auto speed determination
SITOR-A
SITOR-B
ASCII (ITA-5/IRA) 75, 110, 150, 300, 600, 1200 Baud

ARQ-E 48, 64, 72, 86, 96, 144, 192 Baud
ARQ-E3 48, 64, 72, 86, 96, 100, 192, 200 Baud
ARQ-6-90 200 Baud
FEC-A 96, 144, 192 Baud
FAX 60, 90, 120, 240 LPM: 288, 440 or 576 IOC
AX.25 Packet 300, 1200 baud
POCSAG
GOLAY
ACARS
CTCSS 41 standard frequencies
DCS (PL) 104 standard codes

Analysis Tools: On-screen tuning and staus information. Multiple
Scroll Inhibit, Over-print Inhibit, Automatic
Threshold Control, Databit and Literal modes.
False colour and zoom for FAX. Incoming text can
be saved to disk. User programmable memories and
on-screen datascope.

Extras Required: IBM compatible PC with VGA or EGA colour or mono monitor

Supplier: (US) Universal Radio, 6830 Americana Parkway,
Reynoldsburg, Ohio, OH 43068, USA Tel: 614 866 4267

(UK) Martin Lynch, 140-142 Northfield Avenue,
Ealing, London, W13 9SB, United Kingdom
Tel: +44 181 566 1120

Approx. Price: (US) USD400
(UK) GBP400

Decoder: Universal M8000 (version 5)

Level: Professional-grade, sophisticated decoder for Experts

Synopsis: Stand-alone decoder much used by professional and
semi-professional monitoring agencies around the
world. Decodes just about anything that you'll
hear on VHF or HF, but not quite in the same league
as the Hoka PC-based systems or the Wavecom family.
Can be fully controlled by a computer or terminal.
Ten memories can be used to store favourite
operating settings. Housed in a standard 19 inch
rack mount cabinet.

Modes Decoded: Baudot RTTY 20 to 250 Baud, auto speed determination
CW (auto speed determination)
SITOR-A
SITOR-B
ASCII (ITA-5/IRA) 75, 110, 150, 300, 600, 1200 Baud

Piccolo 6 tone
ARQ-M2 86, 96, 100 Baud
ARQ-M4 172, 192, 200 Baud
ARQ-E 48, 64, 72, 86, 96, 144, 192 Baud
ARQ-E3 48, 64, 72, 86, 96, 100, 192, 200 Baud
ARQ-S 4, 5, 6, 7 character blocks
ARQ-6-90 200 Baud
SWED-ARQ 3, 9, 22 character blocks
FEC-A 96, 144, 192 Baud
FEC-S 96, 100, 144, 192, 200 Baud
FAX 60, 90, 120, 240 LPM: 288 or 576 IOC
AX.25 Packet 300, 1200 baud
PACTOR 100, 200 Baud
POCSAG
GOLAY
ACARS

Analysis Tools: Third shift Cyrillic alphabet can be printed
on-screen. Literal mode printing of data
received, databit mode, auto baudrate, tuning and shift
determination. Start printer when upto 3 matching
selcalls are received. On-screen tuning scope.
Screen print and screen saver. Multi-channel ARQ
surveillance function. Signal spectrum display.

User settable signal filters. Multiple scroll
inhibit and Unshift on Space. Built-in self test
functions. Display has on-screen tuning bars and
real-time clock.

Extras Required: VGA colour monitor (640x860 resolution or better)
Graphics compatible parallel printer (for FAX)

Supplier: (US) Universal Radio, 6830 Americana Parkway,
Reynoldsburg, Ohio, OH 43068, USA Tel: 614 866 4267

(UK) Martin Lynch, 140-142 Northfield Avenue,
Ealing, London, W13 9SB, United Kingdom

Approx. Price: (US) USD1400
(UK) GBP1300

5-B. HOKA Decoders

Decoder: Hoka Code 3 (version 4)

Level: Comprehensive, sophisticated decoder for Experts

Synopsis: The Hoka Code 3 comes in two parts: an interface box
which connects to a free serial port of an IBM
compatible PC, and the software itself, on a 1.44Mb
3.5 inch PC diskette. The decoder is implemented
entirely in software which makes it extremely
powerful together with a wealth of analysis tools,
most of which are also included as standard. This is
probably the most powerful decoder for its price.
The user has practically complete control over all
important parameters for each mode decoded. Exotic
data systems are available as optional software
modules, at extra cost. Comprehensive on-screen
diagnostics and system information are shown for
each mode decoded. Each module is chosen from a
simple menu system with one-key commands to set or
change system parameters. There is even an
optional module (Auto Classification) which will
look at a signal and tell you what the data system
is! Full Synoptic decoding of meteo AAXX and BBXX
codes is also available as an option.

Decoder: Hoka Code 30 (version 2)

Level: Comprehensive, VERY sophisticated decoder for Experts

Synopsis: Arguably the King of Decoders! The decoder
consists of a card which is inserted into a free 8
or 16 bit slot in an IBM compatible PC, together
with the decoding software on a 1.44Mb diskette.
The decoder board is high-quality, RF screened and
makes use of Digital Signal Processing (DSP)
techniques. Because of DSP technology, the Code 30
will deal with any traditional system plus complex
systems using Phase Shift Keying (PSK) and the like.
Its power and flexibility, due to DSP and software
based modules, means that many government agencies and
military surviellance units make use of the Code 30.

5-C. Wavecom Decoders

Decoder: WaveCom W4010 (version 5)

Level: Comprehensive, intermediate level decoder

Synopsis: The first comprehensive decoder for the amateur as
well as professional user. Now being phased out in
favour of the more up-to-date W4050 but still
widely available on the second hand market. Again,
a self-contained unit requiring a composite monitor for
the control, and incoming text displays. Like its
W4100 bigger brother, this decoder again sports
just about every mode that is in regular use on HF
plus a good array of analysis tools.
Software and modes decoded are held in a number of
EPROMs contained in the machine, amking for simple update.

Approx. Price: DM2,500 (excl. Tax)
CHF2,300 (excl. Tax)

Decoder: WaveCom W4050 (Preliminary Info at March 1995)

Level: Comprehensive, VERY sophisticated decoder for Experts

Synopsis: Will this be the challenger to the Hoka Code 30 and
knock it off its throne as "King of Decoders"?
This decoder is expected to be released at any time
now and will basically be a new W4100. A new PC
control system is also planned to be available at
the same time as the decoder. Full use will be made
of Digital Signal Processing (DSP) technology allowing
for the decoding of traditional, and more complex
systems, like DPSK, QPSK etc. Otherwise just like
the W4100 with a very powerful suite of analysis
tools and modes that can be decoded.

Approx. Price: Unknown at time of writing.

Decoder: WaveCom W4100 (version 2.5.09)

Level: Comprehensive, VERY sophisticated decoder for Experts

Synopsis: Until the Hoka Code 30 came along, this was
probably the decoder of choice for professional
monitors in military and government agencies. The
W4100 is a 19 inch rack mounting machine, self-contained
unit which requires a VGA monitor as a display. If
you want to build your own decoders, software can
be loaded into the machine via a front panel
mounted 3.5 inch disk drive. Like the Hoka
decoders, a comprehensive set of signal analysis
tools come as standard and the array of systems
that the machine can decode is equally impressive.
The display can also show text in English, Arabic,
Cyrillic, and Greek directly.

5-D. Other Manufacturers

Decoder: Lowe Air Master

Level: Entry level ACARS decoder for Beginners

Synopsis: Easy to use software-based decoder from the makers
of the popular HF-series receivers, dedicated to
the decoding of the ACARS aircraft reporting
system. The decoder consists of a small hardware
interface that connects to a free serial port on an
IBM compatible PC.

Modes Decoded: ACARS

Analysis Tools: Unknown

Extras Required: IBM Compatible PC (at least 80386 CPU)

Supplier: Lowe Electronics, Chesterfield Road, Matlock,
Derbyshire, DE4 5LE, United Kingdom. +44 1629 580800

Approx. Price: GBP90

Decoder: Momentum Communications MCL 1100 "Easy Reader"

Level: Entry level decoder for Beginners

Synopsis: A self-contained, easy-to-use decoder requiring a
composite video monitor for the display of incoming
text (monitor can also be supplied by Momentum).
An on-screen tuning graph is displayed together
with a permanent status line showing speed etc.
The system can be manually or automatically tuned
onto a signal. An optional serial port can be
installed to transfer incoming text to a printer or
PC.

Modes Decoded: Baudot RTTY 45.45, 50, 75, 100, 110, 200, 300 Baud

Decoder: ERA Microreader Mk 2 (version 4.2)

Level: Entry level decoder for Beginners

Synopsis: An easy-to-use, self-contained decoder with
integral 16 character LCD display of incoming text.
Decodes all of the basic HF data systems and
includes a Morse tutor facility to help you learn
Morse code. A serial port allows you to send the
incoming text to a PC or terminal aswell as the
internal display. The same company also produces a

decoder for synoptic codes sent by meteo and coastal
stations (cost GBP100) which will connect to a
Microreader and turn the codes into meaningful,
English messages.

5-E. Public Domain Software

Decoder: Hamcomm (version 3)

Level: Intermediate-level decoder for basic HF modes

Synopsis: This PC-based decoder, produced by a German Radio Amateur, is shareware. Being designed by a Radio Amateur also means that most of the modes catered for are also used by Amateurs. The program needs a very simple interface, which is connected to a free serial port on the PC. The interface consists of only a few basic components and can be built at little cost. Many companies also sell ready-made interfaces for both Hamcomm, and its Fax counterpart JVFAX (also shareware). Despite being low-cost the decoder is a fine piece of software and contains features and diagnostics in line with decoders costing over USD100. Comes with a good, beginner's level manual.

Modes Decoded: Baudot RTTY 45 to 200Bd + variable
CW 5 to 40 WPM + variable
SITOR-A (AMTOR ARQ)
SITOR-B (AMTOR FEC)
ASCII (ITA-5/IRA)

Analysis Tools: Signal Oscilloscope
Signal Spectrum Analyser
Bit Length Analyser
Tuning Aid
Meteo SYNOP, SHIP and Weather decoder

Extras Required: IBM Compatible PC (80186 or higher CPU, 400k RAM)
Mono or Colour Monitor (any type)

1 free serial port (for interface connection)

Supplier: W. F. Schroeder
Augsburger Weg 63
D-33102 Paderborn
Germany

Also on many BBSes and Internet Archives.

Approx. Price: Registration Fee of USD30 or DM40

Decoder: JVFAX 7.0

Level: Intermediate-level decoder for FAX ans SSTV

Synopsis: JvFax is a shareware program for the reception of weather and photo style fax. It also includes a transmit option for Fax and an SSTV transmit and receive mode. Reception can be performed automatically and features time scheduling. Automatic creation of weather movies is supported when receiving from geostationary satellites. GIF format is used to store pictures received, but 24 bit uncompressed TIF can be used.

Modes Decoded: FAX IOC between 200 and 576
LPM of 48, 60, 90, 120, 180, 240, 360 and 480
SSTV 8s, 12s, 24s B/W, Scottie S1, S2, DX,
Martin M1 and M2, Wraase 24, 48, 96

Analysis Tools:

Extras Required: IBM Compatible PC w/DOS 3.0 or higher. At least VGA graphics card but supports SVGA in 16 or 256 color mode. A VESA 1.2 bios compatible graphics card is recommended. At least 4 MB of RAM needed. Multitasking environments such as WINDOWS or OS/2 is NOT SUPPORTED.

Supplier: Many BBS's

Approx. Price: Freeware

>to possibly NBS Clock.

I don't know about colorburst, but I remember reading an article in
Radio Electronics a couple years back about using one of the sync signals
in NETWORK TV broadcasts as a standard. Something about the sync timings
from ABC/CBS/NBC being traceable back to NIST (NBS).

Wouldn't surprise me to find that the networks are using certified references
for colorburt, either.

Personally, I think a group of less than laudable people got together and
decided to have fun by posting a series of totally meaningless messages in
a set of totally inappropriate places. Theater of the absurd. Okay guys,
we've seen it; I give it a 3 on difficulty and a 4 on creativity. No
medal, not even honorable mention. So, wrap up the production, go away...
don't call us, we'll call you.

If I was smart, I'd have a clever .sig

Interesting fact...!!! Same thing happens with my IBM Laptop which has an
EMULATED 16550... I attributed this to the software emulation...

What kind of 16550 setup were you using to test with...???
If you do not have a true 16550 (there are NO real ones on anything recent
and modern) then your results might not be true...

>Anyone any idea........

Tell us what card the 16550 is on and if you are using the same I/O card
and just switching the chips, or if you are just assuming you have a 16550
because some software tells you that you do...

Marv... K4BVG

Even when the experts all agree, they may well be mistaken.

>wcabov@Globalxs.nl

Some days later.... here are some facts sofar...

(Michael TA2ZG/W2AV i received your email and i send one back but
your hosts is not reacheble)

Using baycom 1.5 with 3105 chip powered external, has its own power
supply !!
We turned all fifo off, if there were any ....,

Tested baycom 1.5 with a 8250 uart, works oke no problem
Tested baycom 1.5 with a 16450 uart works oke no problems
(ax25 does not want to work with a 16450 !!)

Tested with a 16550 baycom can receive but it cannot send, the only
thing that happens is that it stucks in its send effort, the send led
goes on and stays on untill it times out.

(ax25 does not work with the 16550 , it seems to transmit but does
not receive anything, the same wtih a 16450)

We looked at the data sheets, but it looks oke and compatible,
it should not give any problem....,but in practice it does.

Anyone any idea........

Michael, the blokes at the Australian Defence Force Academy (ADFA) Dr Lawrie Brown, VK1KLB and Warren, VK1XWT, were doing a teaching project that sounds vaguely similar to what you were interested in. They've written an AX25 style packet driver for BSD UNIX and I think they might possibly offer the source code for it on their FTP site:- Minnie.cs.adfa.oz.au.
I am away from the location where my notes on various sites are kept but you'll find somethin' there if you fossick around for a while. It is the site for the Australian Domain Name Server for the VK Packet to Internet wormholes so you'll find lots of intersting bits and pieces there. I can't be sure those addresses ARE absolutely correct, but have a go at it
.
An Email to lawrie.brown@cs.adfa.oz.au (I THINK that's his address) might help. I've been trying to talk them into doing a port to FREEBSD or LINUX for a while but they have no plans on doing it. I guess they are very busy teaching 'n stuff but might be interested in knowing about others who are similarly interested in playing with it.

If you don't have any success with those addresses, get back to me and I'll have had a chance in the meantime to have a look at my Rolodex with all my ham sites on it.

Kindest regards,
Bob.

P.S. Please let me know about your success with it.

I have a KAM+ and there are two things that could cause your problem:

1) The KAM+ has CONOK = OFF

2) The KAM+ has MONITOR = ON and the buffer is full.

Both situations can happen if one has changed terminal programs and
the programs use different interfaces (host vs. terminal) or different
handshaking (hardware vs. software vs. host mode). In those cases,
one terminal application will leave the KAM+ in a mode that the other
application does not understand and/or cannot deal with.

With all due respect, your Kam+ is not likely to have a full buffer if you have a program talking to it. Unlike earlier Kams, your Kam+ has a HUGE buffer. The likely culprit is one of a few parameters that are acting to limit the availability of a connect stream. At the head of this short list are:

CONOK must be ON
MAXUSERS must be >0
USERS must be > 0

If you want to email me your "disp i" output, I can probably find the problem for you.

>minute or so. Any thoughts?

Actually, this is a good way to get long term stability from a crystal
oscillator. A way to do it is to use a phase comparator, a long
up down counter with a parallel output to accumulate the corrections,
and a R-2R ladder feeding an opamp from the parallel outputs to set
the oscillator correction varactor voltage. You can string as many
up down counters as you like together to get the required step fineness.

This doesn't deal with the *short* term variations such an oscillator
suffers. Since you're only offering a correction once every second,
the oscillator is still free to jitter on a shorter timescale.

A slightly more indirect method, which eliminates the phase noise
introduced by the varactor, is to use the output of the up down
counter to drive a proportional crystal oven heater. By suitable
variation of crystal temperature, modest frequency corrections
can be introduced.

This still won't give a good phase lock because of the very low
pass nature of the correction system. To get good hard phaselock,
you need a continous reference signal and a continous feedback
system with sufficient gain-bandwidth to stablize the expected
jitter.

>for colorburt, either.

Two things. First, color burst and the other sync and timing signals are
required to all be derived from the same source. They have to be locked
together to make NTSC color TV work. So all of the signals come from the
same reference, and offer the same stability as the reference.

But the second thing is the killer. The reference is almost always a
simple crystal oscillator operating at 4X subcarrier, IE 14.318...MHz,
at the *local* station. The timing of all signals in the plant, and
from outside the plant via a device known as a frame synchronizer, are
slaved to that simple crystal oscillator. Its basic accuracy only has
to be such that color subcarrier falls within +/- 10 Hz of 3.579...Mhz,
and it is rarely much better than that.

Once upon a time, before frame synchronizers became cheap, the networks
used atomic standards, and their signals were distributed to local stations
via fixed path terrestrial telco microwave links. The local station would
either slave their station master sync generator to the network signal,
called genlocking, or would themselves use an atomic standard to maintain
phase coherence with the network signals. This would allow the local
station to do things like put a super over the network signal, or
crossfade from network video to local video and back again. (If the
signals aren't precisely locked together, very serious artifacts occur
when you try to do those things.)

But two things happened which caused that system to be abandoned. The
first was that frame synchronizers became cheap, and the second was that
the networks started distributing their signals via satellite to the
affiliated stations. The latter induces enough doppler on the network
signal that you can't keep a separate standard phased with it without
resorting to genlock, a form of PLL, so separate very accurate reference

standards became useless. Now genlocking is bad because the networks have a nasty habit of interrupting their feed during local commercial breaks, often to switch satellite origination points, and this would cause the station's local commercials to break up on the air if the station were using the network as a reference. Since it's the local commercials which pay the bills, that's not desirable. But if the station were to pop in and out of genlock for local breaks, the ability to fade in and out of network programming is lost, and the switch itself would disturb local commercial playback. So genlock was abandoned.

Fortunately for the TV station, and unfortunately for those of you looking for an accurate reference signal, the frame synchronizer was developed and became inexpensive thanks to advances in microelectronics. The principle of the frame synchronizer is that it clocks video into a digital memory using a sample clock slaved to the incoming video reference timing, and clocks it back out of digital memory using a sample clock slaved to local station reference timing. Thus it synchronizes out of plant video to the local plant reference. This gets around the problem of slaving the plant reference to an external signal, and eliminates the need for precise frequency standards. Since frame syncs are cheap, and precision references are expensive, the latter were abandoned in favor of the former and TV signals are no longer good precision reference signals.

The networks too adopted frame syncs because many of their feeds now originate from separate locations, often portable uplink stations, and no longer use a precise reference standard either. So you're basically wasting your time trying to use the TV signal as a precision reference because it no longer is a precision reference. You may still find a station here or there which continues to use its relic atomic standard as its local reference, but that's increasingly rare since those things are difficult and expensive to maintain while no longer offering any practical advantage to the stations using them. It's usually cheaper and easier just to buy a new crystal controlled sync generator than it is to try to keep those dinosaurs going.

In TV broadcast, we don't much care precisely what the reference frequency is, as long as all our signals are tied to a *common* reference. It's the difference in timing between two signals that causes NTSC artifacts. As long as we can keep that difference to under 2 nS via frame syncs, we don't care what the actual reference frequency is, and neither does your TV since it slaves itself to the received signal timing.

All the old schemes to use TV signals for precision references are now obsolete, because the TV signal is no longer a precision reference. This has made life a lot simpler for broadcast engineers, but unfortunately sends those of you looking for precision frequency standards back to WWVB. But if you only need a *relative* reference, you can still get that by locking several stations to the received timing of a common broadcast station. If you can tolerate the doppler (actually it's not so much doppler as the path length change as a geosat wobbles around it's assigned orbital

slot over the course of a day), you can even use a satellite feed as the common reference.

Geosync satellites aren't really fixed over a point on the ground. Their orbit is around the Earth's center of mass, and because the Earth isn't a perfect sphere, that causes the bird to vary in position over the course of a day. That changes path length, and thus received phase timing, of the signal. Also, there are other perturbations, IE the Moon, the Sun, etc which cause the orbital position to start describing a figure 8 in the sky. Station keeping fuel is burned periodically to minimize this wobble, but station keeping fuel is limited, so the birds are allowed to wander quite enough to destroy their usefulness as precision relays of phase information. (There are ways to compensate for this, but they're beyond the reach of most amateurs.)

Gary

Gary,

Thanks for another very informative posting. What do you think of using GPS satellites to derive a frequency standard? Tom Clark, W3IWI, has suggested that the time signal from a GPS receiver could be used to steer a local xtal oscillator. I guess you could use a microcontroller board with a D/A output and use that voltage to adjust the oscillator. But various things get in the way. I am sure you have to worry about long term effects. You can't just be bumping the oscillator frequency around every minute or so. Any thoughts?

Ron Long w8gus.

5149. Re: TNC reports that station is busy - but it's not!

>
>My TNC is a Kantronics KAMPlus.
>

Check the following...

1. If you are not at the station, set CMSG to PBBS. This forces all
new connects to your mailbox.

2. Check you MYPBBS setting. Normally this is MYCALL-1.

3. Make sure that your USERS parameter is set to 1 or greater on the port in
question. If USERS is set to 0 no stations will be able to connect to
your TNC.

Hope this helps.

Message-ID: <48tf40$m1v@mdsroc.com>
Source record: 40434

I'm trying to get JNOS ver 1.10L working with a BAYCOM modem on a ZENITH 286 portable. I tried the AX25.COM TSR program and it transmits and beeps that it has a valid frame but JNOS dosn't display the frame. So close yet so far. Also won't work on a Pentium and 486DX100. Baycom works 100%.

Has anyone gotten a BAYCOM modem solution going with JNOS? And no, I'm not going to put a TNC and it's associated cost and power supplies in line. I'm using this combo to diagnose a GRACILLIS node that is in a cramped room and I would like to keep it simple. I could abandon JNOS but that is what we use in Rochester.

Thanks for reading this.

5155. Announcing the TAPR Virtual Meeting Page

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-21 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <434128.ensmtp@teachnet.edb.utexas.edu>
Source record: 40437

TAPR is proud to announce the creation of a virtual meeting, workshop, and seminar page on the www.tapr.org pages.

On our new pages, TAPR uses the RealAudio system to make presentations available for a few events that many amateurs were not able to attend. TAPR is evaluating the RealAudio system, and its current implementation on the TAPR server is limited. The system only allows 10 concurrent connections, so if you find that an audio channel is busy -- try back at another time.

Please let us know what you think about this -- we really want to hear about your experience with these pages.

Currently, the virtual meeting pages include:

*** 1995 TAPR Annual Meeting, St Louis, MO.

Couldn't attend the TAPR meeting in March of 1995 ? Well - here is your opportunity to listen in to both the Sunday workshops. The TAPR/AMSAT DSP-93 Workshop by Bob Stricklin, N5BRG, and Tom McDermott, N5EG as well as a seminar on Error Control Coding by Phil Karn, KA9Q are made available. Using the Adobe Acrobat format (pdf) we have provided the overheads and between the audio and the overheads you should be able to get a lot from the workshop you couldn't attend!

*** Repeater Frequency Coordinators Meeting, Oct 7th, 1995

Hear the entire meeting of the nations repeater frequency coordinators who met with the ARRL and the FCC in St. Charles, Missouri, October 7th, 1995. Hear what was said by Rod Stafford, President of the ARRL and Ralph Haller, N4RH, Deputy Chief of the FCC's Wireless Telecommunications Bureau. Listen in on the eventual discussions, debates, and eventual outcomes. Read what Newsline published regarding the event.

*** Ham Radio and More Show, August 13th, 1995

Hear the August 13th guest, Greg Jones, WD5IVD, President of TAPR discuss digital issues and what TAPR is doing.

5157. Are you using the old TAPR address ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-21 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <434133.ensmtp@teachnet.edb.utexas.edu>
Source record: 40439

The old Internet address of "dingus.n5lyt.datapoint.com" has been deleted.
There are still WWW pages out there that use this name in their links.

We have been tracking many of them down and asking the maintainers to change
them to "www.tapr.org", but we are sure there are many that have been missed.

Be sure to use ftp.tapr.org for ftp access.

Please pass the word -- and if you find something using the old address,
please correct it or inform those who maintain the site to correct it.

Cheers - TAPR

5158. Periodic Announcement: TAPR

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-21 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <434136.ensmtp@teachnet.edb.utexas.edu>
Source record: 40440

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
TAPR-BB TAPR General Announcement List
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS
TAPR-TNC SIG on TNC Technology

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.tapr.org' in the directory
/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

http://www.tapr.org

Lots of very interesting things to review and look through.

Reply-To: matt@nuthatch.dungeon.com
NNTP-Posting-Host: nuthatch.dungeon.com
X-Offline-Mail/NewsReader: Tetrix Reader Plug - Unregistered - V 1.1.0

The Vfast28.8 GMSK High speed Packet modem.

The Vfast28.8 is a radio modem kit for AX25 Packet radio users.
This new GMSK modem has been developed by G6WPJ & G8STW
specifically for use by Radio Amateurs. The GMSK data modulation
method used is similar to the method used by the GSM digital
cellular radio system.
The Vfast28.8 uses the latest in VLSI component technology .

Feature list.
----

* Half Duplex Data signaling between 3600 and 38400 bits per second.
* Simple plug fit onto many types of TNC .
* TNC 2 compatible 20 way connector on the circuit board.
* Compatible with G3RUH based designs when operated at 9600 bits
per second.
* Fast receive "lock on time" and Data Carrier Detect generation.
* PTT control circuits and Watchdog timer included on the circuit board.
* Easy to use Calibrate and setup signals.
* Audible Morse code Ident generation to meet UK licence requirements.
* Built in data scrambler / de-scrambler as per G3RUH and others.
* Low power consumption.
* Small Circuit board size (140mm x 60mm) with few components.

The kit consists of the following :-

A double sided PTH high quality PCB.
A pre-programmed microcontroller.
A 50 page high quality technical manual.

Price is 39 UK Pounds Sterling in the UK or 45 UK pounds
for overseas. The additional componants required should cost
around 15 UK Pounds Sterling.

The manual is available seperately for 10 UK pounds in the
UK or 12 UK pounds overseas. The manual price is refundable
against the cost of the kit. Prices include carriage.

To find out more look at the following Worldwide Web page :-

http://www.stack.serpukhov.su/~victor/hamradio/packet/vfast288.html

To know more please e-mail: matt@nuthatch.dungeon.com

Thank you for reading this and we look forward to hearing from you.

Hi All,

I just bought the TIMEWAVE DSP 59+. I would appreciate any comments/tips/tricks on using this. So far it looks pretty simple to operate but the manual is a bit scant and does not go to much in depth. It is a marvelous device especially on 160-80-40 in killing the static crashes. Maybe someone has cooked up a table for optimum settings on: SSB, CW, AMTOR, Packet etc...

Very 73

5170. Re: Frequency Calibration BEST ACCURACY

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-22 00:00:00 UTC
From: Tom Clark <clark@tomcat.gsfc.nasa.gov>
Message-ID: <48u9q0$h8e@post.gsfc.nasa.gov>
Source record: 40307

I see my name being taken in vain! Maybe I should make a comment on this thread. I agree with Gary's comments that the TV stations are no longer a good frequency reference since the need for precise timing of NTSC (Never Twice Same Color) sync signals has been obviated by advances in the signal processing.

If ALL stations needing sync are in a local area, ANY broadcast station could serve as a relative frequency standard (AM, FM, TV or whatever). Just lock to the same carrier and the deed is done.

If you are not in the same area, the best way is to use some signal you can all see (like a geostationary satellite) but this means a fairly major hardware investment -- the NOAA GOES satellites can and are used in this way, but you need to make an L-band downlink at each users's QTH. Not simple, not cheap.

Any more, by far the best way is to use GPS. The L-band hardware has become a commodity item and the signals are strong. The satellite downlink antenna can be made for < $1.00.

The GPS satellites all have Cesium clocks onboard. It is possible for you to get Cesium quality standards in your shack. The best way to do this is to realize that each GPS satellite sends a time code. Unlike WWV, the spread-spectrum equivalent of the time ticks come at a rate of one code cycle per msec. The code is length 1023, so the equivalent pulse rate is ~1/usec. It is possible to get timing to about 1/10 to 1/20th of a bit, so your hand-held GPS receiver has in it a clock that is sync's at the ~100 usec level. It has to, or you wouldn't be able to get positions at the ~30 meters level (30 meters = 100 light nanoseconds).

Unfortunately the average small handheld GPS receiver doesn't have a convenient time output spigot, but some of the board-level OEM receivers do. My "Totally Accurate Clock" project has been using one such receiver, the Motorola ONCORE (when equipped with the timing "Option A"). Let me first comment on the "TAC" name -- some years ago Heathkit had a WWV-based desktop clock they called the "Most Accurate Clock" and today (see you airline seatpocket magazine) Hammecker-Schlemmer sells the German Junghans clock which uses WWVB (60 kHz in North America) or DCF77 (77 kHz in Europe) under the "Most Accurate Clock" name. My "TAC" is 4 orders of magnitude (yes, 40 db!) better than "Most", so the "Totally" name seemed appropriate {and "TAC" are my initials ;-) }.

Ahh -- but some of you will say "the Military, in all their esteemed wisdom, diddles the signals destroying the clock performance". Not quite -- we've spent a lot of time & effort characterising the "Selective Availability" diddling and its effects can be minimized. In particular, the SA clock diddles are not coherent between the different GPS satellites. If you can average over several satellites, then the effects are reduced as sqrt(N).

The other "trick" to get good clock performance from GPS is to not have your GPS receiver trying to determine positions. Take a day, observe the position, and then lock the receiver so that all the satellites are used to obtain timing info. {Normally, to get a 3-D Lat/Lon/Hgt position, the receiver requires at least 4 satellites, since it also has to have data to synchronize its internal clock.}

This is where the off-the-shelf Motorola receiver comes into its own. Motorola did all the right things to do good timing. You can constrain the position and if you do all the satellites that the 6- or 8-channel receiver sees can be applied to sqrt(N) reduction of the timing inaccuracies.

Invoking these ideas, the "TAC" (using the older 6-channel ONCORE) routinely gives 30-50 nsec RMS timing precision. I am able to measure this because the "TAC"s are in use at stations with very stable Hydrogen Maser frequency standards. The average Joe Ham would have a hard time making this statement since an H-Maser is typically a $250,000 to $400,000 rack-sized widget. I've also been able to test the ACCURACY of the time the "TAC" produces and get a daily average at the 20 nsec or better level with respect to the US Naval Observatory's Master Clock. If you want to see some of the details of the "TAC", feel free to browse this URL:

ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/

OK, so now we have good time. The original thread asked for good FREQUENCY control. My scheme is to start with a high quality crystal oscillator at a convenient frequency (like 10 MHz) and divide its output down to 1/sec. This "tick" is compared with the GPS-derived 1PPS "tick" with a time-interval counter. Average the time interval for about an hour and compare it with the value from the previous hour. If it has drifted, apply a small analog tuning voltage correction to the Xtal, nudging it slightly. Continue the process until the timing drift goes away. If you achieve 1 usec drift over ~3 hours (10,000 seconds), then your crystal is on frequency at a level of 1 part in 10e10. If the drift is at the 1 usec level for a day (~10e5 seconds), then the stability is 1 in 10e11. This figures are comparable with a Rubidium standard and the parts cost is < $1000.

I have thought about making a "TAC-II" which would augment the current "TAC" with a ~$50 xtal oscillator, dividers/counters, a small microprocessor and a high resolution D/A converter. I would appreciate feedback on the usefulness of such a widget in the amateur world if the cost was (ouch -- hams are cheap!) ~$1000. Please give me feedback on the utility of such as project. It would probably be distributed as a kit thru AMSAT/TAPR channels (like the DSP95 box).

73 de Tom, W3IWI

5171. Re: Baycom and a 16550 uart ????

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-22 00:00:00 UTC

Message-ID: <48ubh3$8jh@newshost.lanl.gov>
Source record: 40308

Yes, you can.... with Windows '95 Baycom runs practically as
well as it did under DOS alone. As I type this into Netscape
mail, my baycom window is receiving and displaying the local
packet activity and I notice no slowing down of my keyboard
response or hesitation. The Baycom window (while in background
mode) acts similar to the "background" mode of DOS-only Baycom:
It receives but does NOT respond to polls, connect requests,
nor will it transmit until activated into the foreground
window. But it's still very nice to be able to monitor the
packet racket and with a mere click of the mouse begin a
connected session with someone.

I totally agree with your post, as I am a "primo" "stupid idiot" running baycom on a Pentium Win '95 system, as well as other useful and interesting DOS apps. Being able to use this high-performance system with a packet window running in the background comes in very handy, though of course those of us who have tried most of the Baycom/Digicom systems realize a Commodore 64 running Digicom outperforms a Pentium running baycom hands down.... Digicom will even accept higher baud rates than Baycom will. Baycom doesn't allow access and control of the outside world via any I/O port as will many versions of Digicom. However, the poor C64 in question won't run windows, netscape, MS word, etc, all at once.
Packet radio itself, especially the 300/1200 baud variety, is a simple task for even the oldest slow machines back as far at least as the Apples and Ataris and C64's, the Aussies even had a tnc emulator written for the Vic 20. That doesn't mean it's not a fun or even at times useful mode to run on a modern day super-kilobuck whiz machine (IMHO of course).

I used to think it was unpossible to make a baycom soft running under
windows, since it requires permanent quick access to hard interrupts.

I also used to think that for the same reason it was not possible to
make a baycom soft run under Linux (and I haven't found any soft).

Does anybody know which company makes QPSK demodulators.
They should derive their clock from the baseband signal.
The data rate will be 1 Megasymbols per second.

THANKS

Jens

5177. Baycom Type Modems - Power?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-22 00:00:00 UTC
From: g-taylor4@tamu.edu
Message-ID: <48vets$kr4@news.tamu.edu>
Source record: 40314

As someone just starting to look at packet....is there a way to
tell ahead of time if portable Baycom type modems will
take power from the computer or if a separate supply is required.

Is it safe to assume if the computer won't power a standard pocket
modem it won't power a Baycom-type modem

BTW I'm using Baycom-type modem as a generic term for any of the
small, portable (cheap) modems which may or may not be correct usage.

tnx...Greg, KD4HZ

From: kbain@aol.com
Message-ID: <48vnh3$6go@newsbf02.news.aol.com>
Source record: 40317

Take a look under this url:

http://www.tapr.org

There is a Texas Home page, and on that there are several cities with gateways. I access the Mount Pleasant gateway on 2m and then telnet thru the internet to other servers, but with clearance, you can go out on 440 or 2m via the internet connection to local tnc's, or access other servers thru this gateway just like we do on 2m.

Hope this helps!

Kenny, KB5VME

From: gerheim@sonalysts.com
Message-ID: <48vvqn$73e@hatch.sonalysts.com>
Source record: 40319

I've been working new states on Packet by looking for open mailboxes in the unattended packet subbands. If I find a mailbox, I connect and leave a message. Just Hello, nice signal, name and QTH. So far I've received QSL's from 2 new states (bringing my total on RTTY/Data to 44) this way.

I also leave my HF station on unattended for maybe 2 or 3 hours at a time in the PM, usually on 20 or 30. I beacon every 2 minutes or so. Flame me. I still don't think this is excessive.

Has anyone else tried it? I sure wish more people would leave their rigs on unattended, especially stations in DE, SD, WY, UT, VT and WV :-)

I have my BAYCOM working on a 486 DX2/50 that has a VLB ide controller card
with two 16550 emulations on it... I say emulations, but I have NO idea
what is happening inside the two (total) chips on that card... TINY
card...!!! All the test programs report two 16550 UARTS... Works great
but I haven't tried it in Windows...

What I do have running in Windows is an old DRSI card... I load the DRSI
driver at boot up time and run the THS terminal program in a DOS window
under Win 3.1... Works great...!!!

5187. Baycom and a 16550 uart ????

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-22 00:00:00 UTC
From: michaelm@doruk.COM.TR
Message-ID: <9511221214.aa29489@bbs.doruk.com.tr>
Source record: 40324

I've been following this thread on here as well as corresponding with the original poster (Wim, PA0WCA) directly via email. Wim has a real problem in getting his Baycom software to work on different UARTs. He has tried 8250, 16450 and 16550 with both Baycom and AX25 with really peculiar results. Maybe he has a hardware problem, maybe software. He's working on it.

I have an interest because I'm working on a modification of AX25.COM that allows it to work with BPQCODE as an external driver. Jon, G7JJF, did this a couple of years ago (BPQAX25.EXE) but his code is in C and the TSR is quite large. I'm working in assembler and the TSR size is under 10k bytes including a transmit buffer, so I think it can be a useful contribution. I need to know if a real problem exits with UARTs other than the 8250 which is all I have here to test with.

The interesting thing to me is that there have been a lot of comments of the type 'maybe the FIFOs are on' (they aren't, Wim checked that already) or 'maybe there's a bug in the UART'. No one has actually said 'I use Baycom (or AX25) with a 16450/16550 UART with no problems' - or otherwise.

So, how about it? Is anyone using Baycom or AX25 on other than an 8250 UART? Any problems or special parameter settings? Which type of modem? I think that any factual contribution could be of use.

And... the flamers with $95000 Mercedes or whatever can keep their opinions to themselves. This is a hobby, remember? We do it for fun and to (we hope) learn something, maybe to contribute something.

From: candea@ATHENA.MIT.EDU
Message-ID: <492p7f$3dd@senator-bedfellow.MIT.EDU>
Source record: 40325
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,alt.radio.uk,aus.radio.amateur.misc

I apologize if I am posting this to the wrong newsgroup but I am in desperate need of advice. I have a Pioneer KE-A530 car radio + cassette that my friend removed from his car a while ago. I am not sure which wires go where because I don't have the manual anymore and there is no indication on the radio as to what each wire is. I would appreciate if any of you could tell how to make the connections (i.e. which is PWR, GND, speakers, etc.).

The wires are in three "bunches":

Bunch 1: blue
black

Bunch 2: green/black (2 wires)
gray/black (2 wires)

Bunch 3: black (this is definitely a GND -- connected to case)
red (has a 0.5 Amp fuse on it and a little box)
yellow
orange (this must be PWR -- it has a 0.5 Amp fuse)

I really appreciate your help. I reply to my personal e-mail address, as I do not read this newsgroup regularly.

Thank you,

Some things got mixed up here...
Actually there is a Baycom modem for 9k6 for the parallel port. But there is no PIC involved... It is on the market now for 1 year (as far as I remember). There is a new design for a 9k6 modem by the Baycom (DK9RR) using a microcontroller (68HC705). Have a look at their www-pages (http://www.baycom.de)

The 9k6 modem utilizing a PIC is done by Henning DF9IC. Currently it is build as a plug-in modem for the new TNC2x by Stefan DG8FAC (TNC2 clone using a Z80 compatible microcontroller). I think it will be available as a kit here in Germany some time next year. But it definitly will not work on the parallel port.

Source record: 40332

"Six meter packet, hmm . . . I don't know about that."
That's what most people would say when you mention that. Then again,
a lot of
people squirm at the mention of six. Well, here's my idea. In the
December CQ magazine, (page 58) there is a design for a _one-chip_ (not a
typo) FM transmitter for
six meters. (You can thank the popularity of cordless phones for that!)
It uses a
Motorola MC2833 IC called the Low Power FM Transmitter System.
In the diagram, the transmitter is set up as a voice FM transmitter.
What would stop you from attaching a 9600 baud FSK modem?
The article also mentions a FM receiver printed several months ago,
which I have not yet seen.
Any and all feed back appreciated.

5196. Running programs in JNOS110L?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-23 00:00:00 UTC
From: 94_089@svc.fcj.hvu.NL
Message-ID: <00999D35.4129B226.575@svc.fcj.hvu.nl>
Source record: 40333

Hello,

Is it possible to run 'external' programs in JNOS110l?
I like to program in PASCAL and I already wrote some PG-Servers for FBB.
But now I want to do the same for JNOS110l. Is it possible?

I don't want to modify the source of JNOS, since I don't have it, and I'm not a programmer in C.

Any reply's to this list or to my e-mail-address will be apreciated.

Thanks,

Remco van Essen, the Netherlands

Hi Stan,
Fancy meeting you here! I am not familiar with the 725 but perhaps
the filter switching matrix can be modified to allow use of the 500hz
filter in ssb. I recently installed a 250hz cw filter in my 765 for use on
RTTY. I added a diode to the filter matrix to allow use of the filter when
in the RTTY mode. Works great! You might want to subscribe to the
RTTY mailing list (I think the address is wf1b-rtty-request@ve7tcp.ampr.
org). There are a lot of RTTY contesters that could help you.

5202. Read Ute Hunter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-23 00:00:00 UTC
From: rttyman@wwa.com
Message-ID: <491151$k5n@kirin.wwa.com>
Source record: 40339

Want the latest utility station-related news
that will give you insight into what you are
hearing over the radio and satellite spectrum?
Want to see lots of loggings from fellow ute
monitors from around the world? Tired of
reading similar loggings in national magazines
that are up to six months old before they
appear in print? Then you should subscribe to
Ute Hunter.

Ute Hunter is a monthly publication that began
in November 1994. It is edited and published
by a former columnist for a national magazine
read by ute monitors such as you. Whether you
have a liking for news about the military,
aviation, satellites, space programs, marine
radio stations, ships, numbers stations,
digital data (such as RTTY) stations, Morse Code
transmissions, diplomatic stations, radio beacons,
etc., exclusive of amateur radio, you'll always
find something of interest to you.

Ute Hunter devotes more pages monthly to utility
station news and loggings than do Monitoring Times,
Popular Communications, and Shortwave Magazine
COMBINED. And like those magazines, you're welcome
to contribute your own news, views and loggings that
will be enjoyed by fellow hobbyists from the person
next door to one in the most desolate outpost on
Earth.

Ute Hunter is mailed by 1st-class mail to North American
addresses and by airmail elsewhere. The rates are:

USA Canada/Mexico Rest of World
One year $60 $65 $70
Two years $110 $120 $130
Three years $160 $175 $190

Sample and
back copies $6.00 $6.50 $7.00

If interested, send e-mail message to rttyman@wwa.com. In
the BODY of the message type "subscribe ute hunter." A
return message will provide further subscription information.

Hurry and subscribe, and be among the first ute monitors to know quickly what's happening and where it's taking place. I'm eager to inform you.

73,

rttyman@wwa.com

The root cause of this problem are the 'original' postings of one BURT FISHER.
His garbage gets replied to by others who inadvertently post to all the
newsgroups the original spammer included in the distribution list.

In the future forward a copy of spam messages from Burt Fisher to the
postmaster at his service provider. Fisher's address is:
k1oik@ccsnet.com therefore you can forward his crap back to place it came
from at postmaster@ccnet.com.

If enough of us do it he will get tired of it and take steps to stop it.
There is no need to even write anything on the forwarded message. They
know who Burt Fisher is, do you think your the first one to complain!? :)

Aside from being a processed nuclear survival food, spam has its own endearing definition as it related to the Internet.

"Spamming" is when a message is posted to serveral, even all, newsgroups at once. Prime examples of spamming occur when some goober posts a "Make 20 Zillion Dollars by Picking Your Nose" post to every single newsgroup in existence. Then, in each of those newsgroups 50 people post a response saying "I picked my nose and only made $.73 you &***#$%!!!!". Most usenet programs will then post that reply to every group the original post appeared in.

I notice that I am posting this response to all the rec.radio.xxx groups. Since I don't know where this thread originated, I'll leave it that way....and now I too have become a "spammer"!!!

Hope it is now clear as mud!

Not a blessed thing. The MC2833 is a nice little FM transmitter subsystem.
I've used it in several small projects. I haven't seen the CQ article,
so I can't say if their circuit will work at 9600, but the chip certainly
will (at at higher baud too). Call Motorola for the app note.

Now realize it's only capable of 10mW, so an amplifier stage should
follow it, and a filter to keep the emissions legal.

> The article also mentions a FM receiver printed several months ago,
>which I have not yet seen.
> Any and all feed back appreciated.

Again, haven't seen their article, but I've used the MC13135 single chip
receiver for several small projects. It'll work just dandy as a 9600
baud receiver (and higher rates too). Again, call Moto for an app note.
Sensitivity is 0.7 uV for 12 db SINAD, so a stage of preamp might be
useful in some cases. The chip also has a very nice RSSI output with a
65 db dynmamic range. That has a number of uses, including driving the
Y axis of a scope in a homebrew spectrum analyzer (X axis can be the
VCO tuning voltage), or for use in a handheld fox hunting receiver.

>But now I want to do the same for JNOS110l. Is it possible?

JNOS Version 1.10L does have both a Multitask and Shell option if it is compiled in the version you have. The problem would be that you can run only a very small program when shelled out into a DOS enviroment.
The sourse code is widely available for download from many ftp sites. If you have a friend that is good at 'C' then this could be an option for you.
I use ftp.ucsd.edu to get mine and compile after modifying it.

From: aswNS@hamp.hampshire.edu
Message-ID: <b177cb$ac25.19@news.hampshire.edu>
Source record: 40348

On Wed, 22 Nov 95 14:16:36 GMT Greg Taylor (g-taylor4@tamu.edu) wrote
in rec.radio.amateur.digital.misc:

: As someone just starting to look at packet....is there a way to
: tell ahead of time if portable Baycom type modems will
: take power from the computer or if a separate supply is required.

If your system is a desktop it probably will supply power to a Baycom
modem OK. If it is a portable it is chancier. It may depend upon the
battery voltage of your portable.

It may help to explain how it is supposed to work: a Baycom type modem
gets power from the serial port transmit data (TxD) and DTR and RTS
status lines. The TxD line is not actually used for data in Baycom,
it sends its output by toggling the DTR line. The RTS line controls
the transceiver push-to-talk line. All of these outputs are at a
logical 0 level (which for RS-232 is a positive voltage) at least part
of the time. These outputs are connected through diodes to charge a
capacitor at the input of a regulator that produces +5 volts for the
TCM3105 and other TTL level chips in the modem. The diodes prevent the
capacitor from discharging and prevent the three RS-232 lines from
shorting each other out. The idea is that the voltage at the capacitor
will remain high enough (above 7 volts) that the regulated +5 output will
be steady.

RS-232 levels on a desktop computer will generally switch between +12
and -12 volts, since these voltages are provided by standard PC power
supplies. RS-232 voltage levels are allowed to be much lower than
that, however, and a portable computer may have RS-232 levels much
lower than that, the positive output may be as low as +5 volts. This
is not enough to drive the regulator in the modem.

So the answer to your question is, yes, there is a way to tell, but it
probably requires using an oscilloscope to look at the signal levels
at the serial port. You could also use a diode, a capacitor, and a
d.c. voltmeter to make the test. If you don't have the
instrumentation you would probably do best by either asking for
experiences with the particular computer, or by borrowing a Baycom
modem from someone else to test it on your computer.

: Is it safe to assume if the computer won't power a standard pocket
: modem it won't power a Baycom-type modem

Probably so, they all use some variant of the same scheme to get power
from the data and status lines.

: BTW I'm using Baycom-type modem as a generic term for any of the
: small, portable (cheap) modems which may or may not be correct usage.

My discussion is based on the circuit of the particular Baycom modem I have, and it is possible the power circuits work differently on other models. Also, it was my experience that one laptop I owned that apparently had adequate voltage levels at the RS-232 port still wouldn't work with the Baycom modem because of some other difference of its serial port from that of a standard PC.

5212. Re: Baycom and a 16550 uart ????

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-23 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <587_9511240129@mba.mba.org>
Source record: 40349

Thomas Brockdorf <tbrock@execpc.com> added to this thread
by suggesting that "16550 does not supply enough voltage
to the modem".

This can't be the problem. The input and output lines
of the 16550 (or any UART for that matter) would be buffered
through line drivers and line receivers. The buffers are in
fact a needed part of the design since they are in fact
inverters and needed to get the correct logic states on the
RS-232 lines.

So any UART will have the drivers, which puts the matter
of "too low voltage" out of the realm of the 16550.

On the other hand, it is always possible that in the particular
case in question, the buffers are of an inferior design and
cannot provide enough voltage and/or currect for the modem
which gets it's power from some of the RS-232 lines. But this
is a matter dependent on design, not whether a 16550 or some
other UART is being used.

Not really. You have posted 'velveeta' (Vegetarian spam).

The difference is that velveeta is crossposted (note the newsgroup line). On the internet, this message will cross the backbone once, and be stored on the ISP host harddrives once, with references to the crossposted newsgroups. It can't even really be called velveeta because you were answering a valid question, even if it was off-topic for the newsgroup in question.

Spam is a message, usually commercial in nature, that is posted once for every newsgroup. In this case, the same message will cross the backbone and be stored on the harddrive once for each newsgroup, resulting in massive waste of bandwidth and disk space.

Internet lore: the term was derived from the Monty Python skit, were 'spam' was said/sung numerous times. It was a really funny skit, too.

Hope this helps.

Hi to everyone, we're interested in a 56kb modem, could you send us information about kits, schematics, pcb's, protocols or anything we can use to make a own design. We also need info about transceptors, antennas, power amplifiers etc...

WE DON'T WANT A COMMERCIAL MODEM, WE NEED IDEAS TO DESIGN IT.

73's from EA7GSA.

Note: This info will be used in a Digital Modulation System for the University of Seville, Spain.

tnx. Andres Marchante Tirado. e-mail: amt@zipi.us.es

I use a DSP-9+ with the KAM, PK900, PK232 and others and it really makes a difference for the digital modes.

Why not just duplicate it on AR ? (links could be added later.)

Of coure high speed radio gear would be required.
Does anybody know who sells either kits or black box gear to
to the job ? Faster than 19.2K.

Radios, TNC's or Modems

Greetings,
Was wondering if 4k8 packet has any following else where in the world. Down here in VK there is some limited L.A.N.'s around with 4k8 activity. Most are in NSW from what I've seen. There are a couple of simple modem designs apparently floating around , which make it cheap and easy to get on 4k8. There is apparently no need for heavy radio mod's(in most cases), I'm told.

Reason for the enquiry is that there has been some discussion at my club about the feasibility of getting a 4k8 local area network going in our area, basically as an experiment. The idea was to source a good and readily constructable modem design and run a club project to source bulk components , and construct the modem "kits" on a designated "project" night.

The advantages to 4k8 that we considered were the economic , no special radio's or mod's required, the possibilty of 2 metre operation, all round it appears worthwhile for our little network on the peninsula here. We could open a 4k8 port on the club BBS (I co-sysop) , and as increasing numbers of people used it, I believe the advantages of the superior thru -put would encourage many to follow suit.

In VK4 it was decided by the digital group here that 9k6 was all they would sponsor apart from 1k2 , but the cost factor alone would prevent many packet op's from even considering this as an alternative . Most run homebrew modem's or cheap TNC's , and basically the law of diminishing returns means all that expense to be able to read a bulletin a little faster,isn't enough to encourage "change".

Any input on FTP sites with design info for 4k8, and input from personal experience with 4k8, it's pro's and con's , etc . would be appreciated.

Thanking you in advance.....Paul. VK4XD @ VK4ITM.#BNE.QLD.AUS.OC

By just talking about the speed of the modem, you don't define the system..

For example: a 9600 bd modem (G3RUH type) can also be used on 4800 bd.

Here in the Netherlands, the 4800 bd modem from the HAPN group is much used.
(original design by VE3DNL, aug 1988). It's a 'duobinary coding' system.
The big advantage over the G3RUH 9k6 system is that there are no
low-frequency parts in the generated audiosignal. Therefore it can be
used on VCO-modulated transmitters. You still need direct interfacing with
the FM discriminator / modulator however.

The disadvantage : less spectrum-efficient and needs more signal for the same bit error rate as a G3RUH type modem.

The carrier detect circuitry on the HAPN / VE3DNL modem is a noise-type squelch circuit. It can coexist with other modulation types on the same channel. A G3RUH modem only 'sees' it's own type of signals - making it impossible to combine it with 1200bd for example.

>I do not read this newsgroup regularly.
>
>Thank you,
>

I'll try, but dont blame me if it blows up!!!. Ok...start with bunch 3. The black wire goes to battery negative terminal, or chassis ground. The red wire with fuse holder and box (noise filter, likely) goes to ignition ACC ON. T The yellow wire is used if you want to send a signal to an auto amplifier (external power amp, subwoofer, etc) or a power up/down automatic retractable antenna. The orange wire might be to control a clock if the radio has a clock built in. Orange wire would then go to the battery and the red wire would go to the acc side of the ignition switch. Then, when you turn the car -on-, the radio works. Otherwise, when the car is off, the only power received by the stereo is on the orange wire and the only operating function is the clock. Only when the car is -on- does the radio/tape actually work.

bunch 1 : blue/black...bunch 1. not sure, possibly line in for an equalizer.

Bunch 2: most likely, this is left channel positive and negative (to speaker left)
most likely, this is right channel positive and negative (speaker right)

Without trying it, it's hard to say. Does the radio have a "fader" for
front-and-back speakers, or is it only a 2 channel output (left and right but no
front and back)???

Keep your posts here...someone can probably help ya.

>

I played with one of the BayPacs from Tigertronics and it worked great on a Zenith Lap-top I had. When I upgraded my computer to a notebook, with all the power-saving hardware, it wouldn't work. According to the docs that came with it, it required at least 10V from the serial port but I could only get about 9V. I called Tigertronics and they couldn't figure it out so I ended up selling it and getting a KPC-3. I would concur that your assumption of the running of a modem being indicative of the ability to run the BayCom modem is correct. If you have an old, big laptop or a desktop, it should run. If you have a powersaver notebook, I doubt it will unless it is modified to supplement the power supply through the serial port. My advice is to test the voltages on your serial port and if you don't get any over 10V, I can't remember which pin is +V, You may be out of luck. Gary Coffman would probably have a more definitive answer for you. He's quite helpful in this group.

Hi - I have a question about KaGold. I'm using a KamPlus with HostMaster. I was seriously thinking about KaGold and downloaded the demo. I was VERY disappointed to find that I could not monitor the PacketCluster and HF modes on the same screen, as I can do with HostMaster. What's the point of having a dual-mode TNC if you can't see/use both modes at the same time? I wonder what you think of this?

If your'e thinking of using a cable box as a receiver, be aware that the noise figure is terrible (7dB or worse) and a low noise preamp will be mandatory. The signal level converter boxes are designed for is between -20 and 0 dBmv into 70 ohms. Thats a lot of power. Send me a SASE and a buck and I'll mail you the list of frequencies.

That's strange. I've never had that trouble with any of mine. I have used a
KPC-3, KPC-9612, KPC-4, KAM and a KAMPlus and the monitor has been
on in all of them with no access rejection. Interesting.

Jay,

In a private message some weeks ago, I explained the exact procedure to
do this in the demo, and in the current release version.

The ability to monitor PacketCluster and another connection/mode is an
important feature of KaGOLD.

If you're having difficulty making it work, please feel free to contact
us, we'll be glad to help.

Hi folks.
I am a stupid lowly grad student taking a course in Satellite
Communications. I need to define a commercial application.
I have chosen video-teleconferencing. I am looking for
people with experience with commercial satellite communications
systems to correspond with. I have studied a lot, and can
actually ask some halfway intelligent questions. Are you
familiar with link budgets, EIRPs, PFDs, TASO, the Crane model,
etc?

A couple of specific questions that come to mind at the moment are:

1. Do you know of a specific comm satellite that would be appropriate
for a videoconferencing link? What is the longitude of the satellite?
What company operates it? Do you know who I might contact to get some
specific satellite parameters, such as the number and type of channels
available, EIRP, etc.?

2. Do you know of any good publications that have specific information
about communications satellites, such as their dates of launch, uses,
coverage maps, etc.?

Please email me at jimdiski@wam.umd.edu !!

Sincere thanks to anyone who may take the time to respond,
and thank you all for your time.

Jim Diskin

> I WAS WONDERING IF ANONE KNOWS A WAY TO PUT A MUD (MULTI USER
>DIMENSIONS) ON PACKET. CAN IT BE DONE? AND WHAT TYPE OF EQUIPMENT IS
>REQUIRED THANKS FOR ANY INPUT YOU CAN GIVE.

Hi Todd,

there's no difficulty in setting up a MUD in the ampr network. I got
CircleMud (got it from sunite.unc.edu) running on my system
dg1kjd-svr.ampr.org . Generally I'd say there's not much interest in it,
which I can't understand.
The problem might be the slow network.
The setup of the game is no problem, just take a unix system, fire up
the mud and provide a shell script that does a loopback connect to the
localhost with telnet on the MUD port. So your users can log in
(via telnet, netrom, ax25 or whatever) into the shell join the mud by
starting the script. Maybe you might also want to put a note into the
motd-text what you have to do to join the mud.

5262. Help: Kam 5.0 & TS440SA/T

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-26 00:00:00 UTC
From: bhowell@mail.utexas.edu
Message-ID: <498o2m$75k@geraldo.cc.utexas.edu>
Source record: 40387

I am using a KAM 5.0, Hostmaster II+ software and a Kenwood
TS-440S/AT.
I am able to receive and print Amtor transmissions.
I am able to transmit Amtor in FEC and my signal will print ok at the
other station.
I am even able to link with another station (in ARQ).
My problem is this: I can't print (to screen) when linked-up with
anyone.
I am using the AFSK in/out jacks on the back of the 440 for audio
in/out, and always use LSB.

The only possible clue is something in the 440 manual which states:
"For Amtor operation, you should reverse the transmit/receive input
polarity on your AMTOR terminal, since AFSK on the TS-440 operates in
the LSB mode. If you cannot reverse the polarity, you should select
USB mode on the TS-440."

I would like to hear from someone who is succesfully using a KAM
version 5.0, HostmasterII+, and a TS440S/AT.

Thanks, Bill Howell N5ALO

I'd be interested to know why you think that. I had it running at 10ms
quite reliably but seemed to drop a few packets occassionally. Now it
is set to 20 ms and works super on a point to point link with a
similar configuration.

Don't waste your money. This is a warmed over voice radio and hasn't
faired well in BER testing (QST).Plus it is synthesized so the TXdelay
is very high (over 200ms). Get a dedicated data radio like the MJF
8621 (2meters or a TEKK KS900L(440) or Kantronics D4-10(44). The MFJ
and the TEKK cost only about $120, the D4-10 is about $220 (from AEA).
I'm told modified Motorola Mitrex's work well also.

These radios are cheaper they work super and you at least have the
potential of getting high throughput.

No such luck. The problem is that the radio is synthesized, and modulates a VCO directly, which is simply not compatible with G3RUH modulation at any speed. Your best bet is to look for another radio: The MFJ for 2 meters, the TEKK or Kantronics for 440.

Well Dave, you may not know this, but Kenwood has more than one model!
But that's OK, because I can tell you the answer: NO!

The reason is, the KPC-3 won't do 9600.

Get a KPC-9612 and a TEKK KS-900 and use that with a Kantronics
RFC 4-110. That'll give you about 30 Watts, a modern radio, and
the best damn 9600 TNC on the market. Don't buy the Kantronics
mini-UHF Amp. It's junk. If you have a local 9600 repeater, then
the TEKK at 2 watts into a beam should be fine.

>DIMENSIONS) ON PACKET. CAN IT BE DONE? AND WHAT TYPE OF EQUIPMENT IS
>REQUIRED THANKS FOR ANY INPUT YOU CAN GIVE.

> TODD DAUGHERTY N9OGL
> daughert@cnmnet.com

Yeah, you could do it... But it would be a bad idea.
Packet Radio does not have the speed or bandwidth needed to allow users to access the mud. It would be way, way too slow to be of any use. Muds require a near real-time feed back, to give the user that sense of virtual reality. That doesn't happen at 1200 baud, with packet collisions!

Anyway, IF you wanted to do it, I would say:

386/33++, 4mb++ ram, 100mb++ ram (minimum)
TNC
Radio
Linux operating system
TNOS BBS system for linux.
A mud server for Linux

It would be important to obtain a mud server that did not display combat sequences, as they would murder the frequency for sure. Also, all mud objects (ie rooms) should have a minimal text description to, again, save bandwidth.

TNOS will allow users to connect to the mud via AX.25 instead of TCP/IP modes, which is, IMHO, a good thing.

Eh, getting linux and tnos up and running is a HUGE job in it's own right, putting aside the mud!

5281. Winpack 5.13 is out

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-27 00:00:00 UTC
From: mconner@neonramp.com
Message-ID: <49bib0$2d2@neon3.neonramp.com>
Source record: 40268

Winpack 5.13 is now out at various ftp sites, including ftp.funet.fi in /pub/ham/packet/terminal. Improvements over v4.x is compressed forwarding/downloading and collection of FBB headers. The program is a near replacement for TPK, except for a few minor things that TPK does that Winpack doesn't. However, the other functions Winpack has make it a better program overall, IMO. Plus configuration is far less finicky than TPK.

John, I also find a TXD of 2 (= 20 mS) seems to work fine. Despite the TEKK's rating of 8 mS turnaround, a TXD of 1 did show some problems. I personally run a TXD of 3, just to be on the safe side of safe.

5287. AX25 on linux = SUN ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-28 00:00:00 UTC
From: parnoul@amoco.saclay.cea.fr
Message-ID: <49fdqv$dh7@news.cea.fr>
Source record: 40274

Hi there,

I've been very happy installing the AX25 drivers in my Linux 1.2.13 PC box,
and running TCP/IP applications through this native mode for a Unix system.
Is this software (AX25 drivers) available for a good old SUN3 under sunos4.1.1 ?

The thing is that for the local Radio Club, it is easier to find an old SUN 3
with 16 Mb of RAM and 300 Mb of disk than the equivalent PC box to properly
run Linux !

Another solution could be to run Linux on the SUN 3 architecture ?

Thanks for your help, and remember to visit our WEB home page on f6kbs.ampr.org,
if you happen to be in Paris and QRV Packet TCP/IP... In a few weeks, should be OK ;-)

73 de f5hnk/Patrick

: >rating of 8 mS turnaround, a TXD of 1 did show some problems. I personally run
: >a TXD of 3, just to be on the safe side of safe.

: It could depend on the software. When there is no sync between the
: 10ms timer tick and the keying of the TX, the TXDELAY could be up to one
: unit shorter than what you specify. I.e. with TXDELAY 1 the actual txdelay
: could vary between 0 and 10ms. In this case, 2 is the minimum reasonable
: value.

: Rob

I'll have to look back thru my TEKK notes and test results. Maybe we're
dealing with more of a TNC issue than an actual radio issue.
Thanks for the feedback.

I recommend against the Kantronics (RF Concepts) RFC4-110, because it is relay switched. The time involved in relay switching will shoot your throughput down to around the 1200 baud level. A better choice would be the Mirage 24N (?), which is diode switched, and puts out about 15 watts. I think they have a higher-powered model, too. (Not sure about the Mirage model number).

Thanks Rob. One of the boards has a TL-074 and the other has the LM324.
I suspect the TL-074 is similar to the 084 and much better than the 324.
I'll change the other too.
Both boards have the MF-10 removed and jumpered out. You're the second
to suggest it...it must be worthy. Thanks again.

>Thank you for your response in advance.

My recommendation would be for one of the Magellan Handhelds.
First, they work above 90 knots, which Garmins (40 & 45) don't.
Second, they're cheaper. And third, they work well when interfaced
to tnc's. I have a Magellan Trailblazer XL hooked to a KPC-3, and
it works flawlessly.

Sure! 1200 baud is what most user ports are running, and 2400 baud doesn't require you to go into the radio, either. Both use the mic input for TXAudio, the speaker output for RXAudio, and PTT and Ground should be self-evident.

The only further option is 4800 baud - some postings here dealt with that recently, and from that there isn't much activity in the USA. A group in Hamilton, Ontario (HAPN) developed a modem in 1988 that works well at 4800, with nay radio. You MUST go into the radio and get audio direct from the discriminator output and inject modulation directly into the modulation input - easy to find if you have a schematic.

If you're not into soldering onto SMD boards, stick to 12/2400.

> lockup time of the average PLL transceiver, and is *not anywhere near*
> the TXDELAY commonly used with 1200 bps.

I agree - some relays can be awfully fast. Not in this case, though. My
RFC4-215 (I think - 440, 2w in, 15w out) required a TXD of 28 (280 mS), and
that was using a TEKK with a TXD of 1! Certainly, throwing the RF sensing
circuit out cut it to TXD 12, but all of that was relay...

Remember, we're talking 9k6, not 1k2, and crystal radios, not PLL.
But, your point is well taken. Pauldon associates in Tonowanda NY makes
a few relay-switched PAs that, if you drive the PTT directly, have a
switching time of less than 40 mSec - with a TEKK, that's TXD 5.

Source record: 40199

```
The Netherlands, November 29, 1995.
Hello dear reader,

NET/Mac v2.3.56 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Fixes for AddResMenu() bug in System 7.5.3
- Implement 'whenquiet <command>' command
- Implemented some temporary mods to keep track of sleeping sessions
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac will be uploaded to PI8HVH.AMPR.ORG, directory public/mac.

Adam PA2AGA e-mail: a.vangaalen@iag.tno.nl for mail to my office and BIG files

: tell me how to connect the KPC3 to the TM251 by the Data Port?

: I have tried every combination possible! Please someone help me!!!!!

The reason that you are having trouble trying to connect the tnc to the rig
via the 9k6 port, is due to the fact that the tnc is a 1k2 tnc and not a
9k6.

To connect the tnc to the rig you will (most probably) have to connect the
audio in (tnc) to the headphone out on the rig, and the data out (tnc), and
the transmit line (to key the rig) - to the mic socket. Although on some
rig's you can pick the audio out of the rig of the mic socket.

Unlike some tnc's the kpc-3 can not be upgraded (if it can be some one
please let me know), and therefore you will have to get a 9k6 tnc
like aea pk-96, kpc-9612, and there is also a 9k6 baycom offering.

hope this has been some help

I am interested in getting into ham radio again and have a few questions.

1) I was going through the books for a "general" ticket some 12 years ago or so (am 40 now). The biggest hang up I had was the morse code. After many unhappy hours going over and over a pratice tape I just put the books away and had given up hope. I hear there has been some rule changes as of late and would like for someone to explain them please.

2) I also hear that you can "ham" over the computer? What is this all about?

3) Any tips on mastering morse without kicking out a window?

Thanks in advance.

-Terry

>I recommend against the Kantronics (RF Concepts) RFC 4-110, because it is
>relay switched.

The 4-110 has a "PTT" jack. Wired to the TNC's PTT you have a very fast
switch. If you depend on the default RF detection switching, then yes, that
would slow things down.

I'd use one of these over the 70's junk radios people are modifying.

5314. Please choke NJ7P/AZNET

Hi all..

I'm looking for information on the commonly-used SSTV formats;
in other words how the data is transmitted over the air.
I have an idea for a new 'breed' of SSTV software, but
haven't been able to find any info on the formats.

I 'spose I could digitize a frame off the air and tear it
apart, but being the lazy sort I am I would rather work from
a specification..

Any ideas ?

Yes, packet would be illegal in these frequencies. However, so
is most of the other activity on these frequencies. One of the
beauties of packet is that you don't have to LISTEN to the
on-channel QRM in order to communicate.

I don't know the RFC4-110, but have you ever measured the switchon time
of relays? Often people relate "relays" to "slow", but I can assure you
that the switchover time of the average relay is *much less* than the
lockup time of the average PLL transceiver, and is *not anywhere near*
the TXDELAY commonly used with 1200 bps.

The local access on the node here is operating on a Storno CQF fixed
radio station which has relays in the power supply AND a coaxial relay,
and it operates very reliably at TXDELAY 30ms. It would work at 20ms
as well.

When something has relays and is slow, the slowness probably isn't caused
by the relays, but by some other slow-settling circuitry in the tcvr, or
a slow HF-VOX in the PA.

Yes Dave, I have been running a 241a on 1200 baud packet for years now. Works great, and I even modified mine with a DB-9 socket in the rear for data. I got the audio from the discriminator too, hence, TNC always gets the correct level, regardless where the "volume" is set at.

HAPN 4800 bps also works well on those transceivers. Just make a
direct connection to modulator and demodulator (like for G3RUH 9600 bps)
and off you go.
Many Kenwood transceivers have the demod connection already on the mic
connector.

snip...

Yes, it's true that if you simply turn off the TNC monitor before powering
down the computer your buffer could fill up if someone connects to your
keyboard callsign and sends enough data to fill the buffer. This is possible
but unlikely. Thank you for pointing this out.

For completeness, I believe the above CTRL-S suggestion will only work if
software flow control is enabled. Also, it's likely that another
crtl sequence will be necessary to enable the data flow when the computer
is powered up again. Of course, these commands could be added to the
beginning and ending macro's if the terminal program supports sending
control sequences. If the terminal program only allows sending text in macro's,
then use the previous suggestion of turning the monitor on and off.
Yes, manual methods can be used but it won't take long before you forget
to enter the command and someone complains about your TNC being busy.

5332. Kenwood TM241 Tech Help Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-11-30 00:00:00 UTC
From: kap01@interserv.com
Message-ID: <49la5q$qt6@data.interserv.net>
Source record: 40219

I need some help with one of my Kenwood TM241's. I have used this radio only for packet and all was well until I decided to
reorganize the shack a bit. When I put everything back together I went to plug the stock mic with DTMF keypad into the rig,
turned the rig on and it keyed and stayed keyed. I took the mic off my second TM241 plugged it in and the same condition
again occurred. Both mics work great on my second TM241. I tried a third mic, one without a DTMF keypad, and the radio
works great. It only keys when keyed.

I tried a reset, but it did nothing to help resolve the problem. I called Kenwood's Tech support, but they had no suggestions
except to send the radio in for service. I can't be the only one to have had this problem. Anyone out there with any
suggestions.

Sure would appreciate some input here. Thanks and Happy HOLIDAYS!

You can drop me a note at kap01@interserv.com

You must be using the RFC 4-32 (3 watts in and 20 watts out) in which case I
think you have a problem as the TXD required on that amp is only 10
milliseconds additional to the radio requirement. The only other 440 MHz amps
they make are the 4-110 and 4-310 (10 in 100 out or 30 in 100 out), and those
require about 150 milliseconds over the radio.

I've been using a 4-110 on my D4-10 port at 9600 baud for over 4 years now and
with the txd of 18, it's working great. Ya, that sounds slow, but it still
beats the dickens out of 1200 baud.

Not quite completely accurate...if pins 4 and 5 (RTS and CTS) are connected
from the computer to the TNC, then when you turn the computer off the TNC will
stop sending the data and hold it in the buffer - with or without a Control-S.
This is hardware flow control. BTW - all Host Mode programs use hardware flow
control, so I suspect that's the problem.

>
Hi folks...

Will just add me two cents worth here -- in my experience, all the above is
correct -- but one more thing: the buffer will only fill if you stop the
flow from the TNC to the computer with CTRL-S before shutting down. Some
programs do this automatically, so it may be happening even if you aren't
sending the command. If the CTRL-S isn't sent, the Kantronics TNC keeps
merrily sending data out to the computer even if the computer is off and
people connecting don't get the BUSY signal.

A KPC-3 will do 1200 baud packet. An FM radio that has voice capability
can do packet without modification. 2400 baud is the limit of unmodified
radios, but the KPC-3 can't do anything but 1200. All you have to do is
wire the KPC-3 to the Tm-241A microphone input, and audio output.
1200 baud FM packet uses Audio Frequency Shift Keying (AFSK), with
tones of 1200 Hz and 2200 Hz. Most radios can handle those frequencies
just fine, since they are made to pass voice.

Terry McCann <tmccann@en.com> writes:

> I hear there has been some rule
>changes as of late and would like for someone to explain them please.

About 6 years ago the FCC changed the rules for the Technician class license. The 5 WPM Code element was deleted. This generated two classes of the same license. A Technician who passes the 5 WPM code test is called a Technician Plus. The Technician has no HF capability, not even 10 meters, or the CW practice bands. The Technician Plus has these additions.

>2) I also hear that you can "ham" over the computer? What is this all
>about?

This started in the 40's. It was called Teletype. Now with the advent of computers, the teletype has been replaced, but the speed is still slow. You can go up to 300 baud up to 10 meters, then 1200 baud on 10, and 19,200 baud on VHF. Even faster on UHF and microwave. There are several modes: Packet, PACTOR, AMTOR, GTOR, etc, etc. Most people use the 1200 baud FM packet in the 2 meter band.

>3) Any tips on mastering morse without kicking out a window?

Try and remember how you learned your ABC's. The teacher used flash cards and her voice. She said A, flashed a card with a symbol on it, and you repeated it. After 3 weeks you knew all the symbols, and could pronounce the letters. Then it got harder. You had to sing a song with all the letters. You had to write your name, then sentences, etc. Whew! man that was hard. Some people never learned, and they never learned how to read and write. Same with morse code. Some people just quit.

Practice, concentration, make it fun. If you're not having fun, go do something else!

Try these web pages:

www.arrl.org
www.tapr.org

5341. Looking for QPSK modulators, demodulators !

Newsgroup: rec.radio.amateur.digital.misc

Does anybody know which company makes QPSK modulator and
demodulator chips? They should work in baseband and be capable
of handling a data rate of about 2 Mbps (1 MSymbols/s).
The demodulator should derive the clock information from the signal.

THANKS

Jens

Muds on packet, what a great idea. Too slow I hear you say, well maybe for some but I used to play one @ Morecombe Bay , and I enjoyed it a lot.
It was (is) a circle mud, and I just selected "brief" etc. for a faster thru-put. Telnet was 44.131.1.166 4000.
I only say I used to play 'cos down here in Brisbane our connectivity has been dicey for most of this year.
It was something-else to do on packet, when I got bored with talking weather on the convers server *8-)

Ken

I have an MFJ-1278 and it works well. I suppose the old line is, what
do you want it to do.

1) VHF Packet - Works very well. Solid as a rock (1200baud)
2) HF Packet - This is where I think it can improve. There is an
upgrade you can get DSP, I gather it is digital signal processing
which is supposed to dig signals out of the noise a lot better. It is
about $200aus.
3) Check to see if the firmware rev is 3.14, it supposedly has
enhanced mailbox options.
4) Have had a bugger of a time, at times to get the thing out of kiss
mode and back to ax25. I don't know if it is the tnc or the packet
program.

I do not use it for sstv, cw or any other mode except for packet. I
spoke to some retailers who started to say it wasn't worth upgrading a
dinosaur and that I should direct my money into a new one..

I am going to keep my mfj on vhf packet and will be looking for a
Kamtronics for HF. Unfortunately here is OZ, you have to buy before
you try so I am a little reluctant to part with $700aus and find out
it is no good !!!

If it fits your need, DON'T hesitate, you've got to use it, no one
else. I coughed up $150aus second hand which is a steal here !!!

120ms in a relay? Maybe there is a short-circuit winding. it could be
done to limit voltage spikes at switching off.
I think it should be possible to improve it...

I have my TM241 happily running 1200 baud packet 24 hours a day. There are some mods given for using it for 9600 baud in a reference book of 9k6 mods published here in the UK.

I haven't tried the mods and I don't think I will. I have just got a KPC9612 and am going to run 9600 baud on 70 cms.

Of course, you mean the Kantronics KAM, don't you?
Which modes do you want to use on HF - different TNCs offer different modes so this would affect your choice.

Regards, Ian.

5357. Re: MFJ v's Kamtronics ?? Any suggestions ??

Newsgroup: rec.radio.amateur.digital.misc

Someone with the amusing address of pete@my.home posted an enquiry about TNCs on HF. Given the invalid addres I really can't tell if he (or she) was serious but here is my response anyway.

The enquiry was about the MFJ versus Kamtronics and, of course, I assume that the author really meant the Kantronics KAM.
Which modes do you want to use on HF - different TNCs offer different modes so this would affect your choice.

Regards, Ian.

: : I have a KPC3 TNC and a TM251(Kenwood 2 meters mobile), The TM251 hs a
: : Data port for 9600bps. I buyed the Data Cable from Kenwood, Can someone
: : tell me how to connect the KPC3 to the TM251 by the Data Port?

: : I have tried every combination possible! Please someone help me!!!!!

: The reason that you are having trouble trying to connect the tnc to the rig
: via the 9k6 port, is due to the fact that the tnc is a 1k2 tnc and not a
: 9k6.

: To connect the tnc to the rig you will (most probably) have to connect the
: audio in (tnc) to the headphone out on the rig, and the data out (tnc), and
: the transmit line (to key the rig) - to the mic socket. Although on some
: rig's you can pick the audio out of the rig of the mic socket.

: Unlike some tnc's the kpc-3 can not be upgraded (if it can be some one
: please let me know), and therefore you will have to get a 9k6 tnc
: like aea pk-96, kpc-9612, and there is also a 9k6 baycom offering.

: hope this has been some help

You can run 1200 on the data port on the rig. The pinout is as follows
(pins numbered 5,3,1,2,4,6 clockwise from the orientation pin at
12 o'clock looking into the port, diagram on page 10 of the book).

1. PKD Transmit data from TNC to transceiver
2. GND Ground
3. PKS Standby, TNC can use this pin to inhibit the transceiver
mic input while transmitting packet.
4. 9600 Receive Data
5. 1200 Receive Data
6. SQC Squelch control output (inhibits TNC data transmit while
the transceiver squelch is open).

Set parameter 57 in menu B to 1200.

Mine is working with a PacComm Tiny-2 just fine at 1200.

E-mail me if you need more info.

SW radio is regulated CB is not. usually CB does not bend over the horizon.
To use SW radio you need an amateur licence...

>
> Does anyone know how possible, leagal and/or expencive is this project?
>
possible, yes. If you've got the licence it's even legal, but still then not
appiciated by other ham's. If you are using CB you'll find the chanels to small
(close together) to use 28k8, common practice on CB is 1k2 or 2k4. This
is due to the bandwith required to transmit 28k8 over loger distances
while leaving some s/n ratio at the receiving end.
1k2 is not expencive, a few bugs for the modem is all you need to spend.
If you're willing to learn for the licence, the ham-radio packet-network
might come close to your needs.

If you want to know more about hams just ask an american ham. Maybe you
should reed rec.radio.amateur.digital.misc for a while.

cu Remco.

For Linux (Unix freeware) there is a kernel implemented AX25 code available.
There is no certaing program to use e.g. Baycom but if you use a TCP/IP
program, e.g. TNOS, by my knowledge you can straightly use baycom.

Hi Everyone--

I'm having a tough time getting my Windoze laptop running NetManage's Chameleon Sampler TCP/IP suite to talk to my JNOS box via the COM port. Pings from the Win machine show up with one 'Bad Header' line and one 'KISS Port 4 Duplex: Half' line. Is there a replacement for Winsock (NetManage's NEWT) that constructs packets correctly?

I've heard from so many people that wire their Win95 boxes to their JNOS boxes, but I never got any details.

Also, is there a free/shareware Internet email package that supports MIME? Commercial apps will also be considered.

Anxiously awaiting..

73 DE Steve N3VZL

---------- forwarded message ----------

Date: Mon, 13 Nov 1995 19:05:27
From: Theodore Peter Vlaar <theo@funkzo.uem.mz>
To: awoodhull@hamp.hampshire.edu
Subject: sign of life again... from Maputo

Can you do me a favor: Put the following question on the net:

I am using here for INTERNET connection only UUCP. This is configured into a package called SNUUPM (SNews, UUpc and Pegasus Mail). On my machine (funkzo.uem.mz) I can create more users. There are no problems and the interchange with the server, somewhere else in Maputo, works fine.

Now I want to install NOS and have a link between this UUPC and my NOS in such a way that I can function as a type of gateway between INTERNET and the radio TCP/IP network (NOS) I want to setup here. So the question is simple: did some one write drivers for the interfacing with UUPC. Can anyone help me with that and answer silly questions.

At the end I want to get the function that someone who sends a mail to for example c91bt@funkzo.uem.mz will find it automatic in his BBS somewhere in the country. From the other hand, that mail is send via my system that contacts every day the (INTERNET) file server and that automatically the from: is changed into an address with funkzo.uem.mz in it.

The formats of the messages in UUPC and NOS are quite different. And I am not a programmer...

Yes it is more than possible to use a Baycom style modem for TCP/IP
and, in fact, I just configured one to work on a fellow ham's '286 AT
laptop here in Alice Springs, Central Australia (VK8). last Wednesday.
Many Internet to Packet Radio Wormholes and Gateways around the world
use this very configuration to cut down on the cost of buying
expensive TNC's for this purpose. The program to get hold of is
JNOS110x.exe. At the time of writing, the current version is
JNOS110L.EXE and this is available from many ham FTP sites around the
world. It uses a Baycom driver called AX25.COM which is available on
most, if not all of those sites. IT is a TSR which MUST be loaded
BEFORE you load JNOS. It has a help file in the AX25.COM program (I
think you type a /? or something on the command line to get some basic
help) and it comes with a more advanced AX25.DOC file in ASCII text
format. That tells all........

Be warned:- While really fascinating stuff to play with and even more
useful to use once its set up, JNOS (or its variants, NOS, TNOS, WNOS,
GRINOS etc) is definitely NOT plug and play software. It's real
techno-nerd stuff but there are hundreds of help files, .DOC files and
books on the subject. You can use JNOS as your standard AX25 vanilla
packet terminal program doin' just what you'd do with normal non- NOS
packet. You can also use it as your standard Internet dial-up program

as well as doing FTP's, TELNET's, SMTP's (Email) on both packet radio and directly on Internet. WIN95 does, in fact, have some NOS (Network Operating System) Phil Karn, KA9Q, software configuration built into it..... Not much, granted, but it's there.....

Some Ham FTP sites to recover JNOS or NOS are:-
ftp://grivel.une.edu.au/pub/hamradio/ucsd/ham-radio/packet/tcpip/
ftp://ftp.ucsd.edu/ (The site above is a mirror for the UCSD site).
ftp://ftp.ucs.usl.edu/pub/ (I dunno the specific directory structure on this one but have a fossick around).

The current "minder"/ author for JNOS is James Dugal, N5KNX.and if you want more info subscribe to the NOS BBS at:
NOS-BBS@carleton.ca (I'm not sure if that's the exact address. Forgive me if I'm wrong.

If I can help, email me. I would suggest, if you're gonna play with this stuff, get your wife/partner to divorce you first. If you're still sane and still in love afterwards, you can have a nice romantic re-union together..... Have a thorough bath/shower first. Its likely to be the last you'll bother to have for quite a while after you start playing with NOS, JNOS, TNOS or GRINOS..... It GETS to you. Real brainfood stuff!

Kindest regards,
Robert.

5366. Get your TNCs ready for Shuttle Experiment in January (SPRE)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-01 00:00:00 UTC
From: tedwards@Glue.umd.edu
Message-ID: <49nmmf$39b@volt.isr.umd.edu>
Source record: 40159

Coming in early January!!!

SPARTAN PACKET RADIO EXPERIMENT (SPRE)

The Spartan Packet Radio Experiment (SPRE) is an Amateur Radio (HAM radio) communications experiment. The primary mission is to test satellite tracking using amateur packet radio and a Global Positioning System (GPS). SPRE was developed and built by the University of Maryland Amateur Radio Association (UMARA) with assistance from NASA, volunteer engineers, and volunteer software professionals.

SPRE is one of four experiments on NASA's Spartan/OAST-Flyer spacecraft. The Spartan spacecraft is scheduled for launch on January 11, 1996 aboard the space shuttle Endeavour as part of mission STS-72. The spacecraft is a cube shaped, battery powered, retrievable satellite. Spartan will be deployed by the shuttle's robot arm and likewise retrieved after approximately 48 hours of free flight.

Mission Objectives:

* Promote amateur radio and amateur satellite communications.
* Test GPS and packet radio based tracking system using a Low Earth Orbit (LEO) satellite.
* Provide an educational tool to inspire elementary and high school students to pursue science and engineering.
* Provide a unique hands-on educational opportunity for college students.

SPRE is designed to relay ground station positions and transmit telemetry containing the GPS location of the spacecraft and housekeeping data. The GPS data is generated by another Spartan experiment.

Special software called APRtrak (tm) will be used at SPRE ground stations to plot the positions of stations and objects world-wide using SPRE transmissions. APRtrak uses full color maps and graphics with the capability to display detail maps of selected geographic regions. Amateur radio ground stations can transmit their locations to SPRE, and if heard, SPRE will relay GPS information back to Earth. All ground stations within range of SPRE will see the relayed stations plotted at the on the map at the correct geographic location. The APRtrak software will also decode and display SPRE housekeeping telemetry including temperatures, voltages, and system status. This software is freely available on the Internet for installation on IBM compatible computers.

This technology has many applications in the amateur radio as well as the commercial worlds. Low cost Low Earth Orbit (LEO) satellites could be used to track storms, weather balloons, boats at sea, trucks, etc.

Satellites could collect the location data from ground targets and download it to ground control stations. If the SPRE mission is successful, this capability may be incorporated into future amateur spacecraft, thus supporting the amateur's effort for technological improvement.

The operational aspects of SPRE will include amateur radio operators throughout the world. Elementary and High Schools are encouraged to enlist the aid of local amateur radio operators to set up ground stations and participate in the SPRE experiment. SPRE can be used as an educational tool in many classes including math, science, and geography.

SPRE can still be used as an educational tool even if a school is not in session during a fly-over. A simple amateur packet radio station can be configured to listen to the SPRE telemetry and record the data for later study.

Amateurs and schools who participate are encouraged to send the data they collect to the SPRE Project to help to piece together a composite picture of the mission. The final results will be made available to participating schools and the amateur radio community.

SPRE will use a ground control network, SPREnet, consisting of specially equipped amateur radio stations to distribute data via the Internet. These control stations will monitor the health and activity of SPRE.

In addition to the amateur radio experiment, the SPRE system will forward to Earth a sampling of real-time telemetry for two of OAST Flyer's experiments: REFLEX and GADACS. Spartan is equipped with on-board recorders to capture data from each of the experiments. Traditionally, an experimenter must wait several weeks to receive the mission data. SPRE provides a low cost, innovative solution giving experimenters the opportunity view a small sample of data during the mission while advancing amateur radio satellite technology.

The sample REFLEX data from the mass spectrometer will be used by the experimenters to provide feedback on how well their experiment is performing. SPRE will be providing GPS location and time information from the GADACS experiment. This information will provide some insight on the health of the GADACS GPS receivers as well as indicate the current location of the Spartan satellite. Using the APRtrak software described above, amateur radio stations and schools will be able to observe the track of the satellite as it passes overhead.

Data is transmitted on a downlink frequency of 145.55 MHz. The is the same frequency used by the MIR space station and the Shuttle Amateur Radio EXperiment (SAREX). The data format is completely printable ASCII characters and therefore is fully compatible with all amateur packet radio equipment in common use today.

All of the hardware and software has been designed and constructed by students and volunteers. This low cost project has provided a great hands-on opportunity to gain experience in space communications. So far,

several students have earned college credit for their work on SPRE. It has also helped some graduating students secure employment in the aerospace industry.

Information Summary

Mission: STS-72, Space Shuttle Endeavour (OV-105)

Launch: January 11, 1996 at 09:18 UTC (60 minute launch window)
Orbit: 28.45 Degrees

SPRE Deployment: 3 days 2 hours mission elapsed time
SPRE mission: Approximately 46 hours

Operating Mode: FM, AFSK 1200 baud packet radio
Frequencies: 145.550 MHz Simplex

Landing: January 20, 1996 at 04:54 UTC at KSC

WWW Home Page: http://w3eax.umd.edu
Anon. FTP site: w3eax.umd.edu /pub/spre directory

Ground Stations:

* Any amateur radio station or school with packet radio capability
* ARPtrak Software (available on the Internet)
- Runs on an IBM compatible PC
- Displays SPRE telemetry
- Unattended data collection capability
- Can replay satellite passes
* Simple packet radio station setup
- Licensed Amateur Radio Operator
- Terminal Node Controller (TNC)
- VHF Radio (amplifier recommended if transmitting to SPRE)
- VHF Antenna (beam recommended if transmitting to SPRE)
- PC Compatible Computer
- APRtrak Software Package4
- Satellite Tracking Software (Recommended)

To Participate:

Schools wishing to participate should contact the SPRE Project for more information and the APRtrak software. Send electronic mail (e-mail) to Ken McCaughey at kenneth@w3eax.umd.edu. Or send a self addressed stamped envelop and a 3.5 inch high density floppy disk to:

Attn: SPRE Project
Century Computing Inc.
8101 Sandy Spring Road
Laurel, MD 20707

For information on local amateur radio clubs, operators, and volunteer instructors please contact Peter Budnik from the Amateur Radio Relay

League (ARRL). Send mail or e-mail to:

Peter Budnik
ARRL
225 Main Street
Newington, CT 06111

Hello all.

I am interested in an interesting idea that I have for my computer:

I want to connect the computer to another one over the radio waves.
I need it to be running 24 hrs a day 7 days a week. It has to broadcast
over about a 60 mile range. And have a speed of about a 28.8 modem.

Preferably I would want a full-duplex connection just hooked up to
modems on both sides. But other similar ideas I want to consider for
myself too.

I live in the US, and in fact I want to transmit from the east cost of New
Jersey to Long Island NY.

I thought that maybe SW radio would be good, since it's a. not regulated,
and b. can bend over the horizon.

Does anyone know how possible, leagal and/or expencive is this project?

(e-mail is prefferable)

I think you can still get a DCD kit from TAPR the Tucon Amateur Packet Radio
group. Try asking for the email addreses for TAPR and I'm almost sure you
can get the upgrade kit from them.

The HEALY node (KG7FU-1) here in Portland uses an Alinco DR-1200T (not
the TH) modified for 9k6. Using the KPC-9612 with K-Net firmware I'm
able to provide a user port with BOTH 1200 and 9600 capability. Works
just fine, except a bit prone to IM at my site.

Hi there,

I run a MSYS packet bbs in Fredericksburg, VA which is 50 south of
Washington, DC. I think you will find that KJ4LQ, N4HOG, or possibly
WB4MIX would get you the results for the east coast areas of the state.
Although N4HOG is closer to the Richmond area.

I have been using DSP-59+ for about a year, including the upgrade chip. Works great, particularly on Digital and SSB modes. My only complaint is the lack of bandwidth of AM mode where performance could be improved. The digital regeneration mode is useful if you have a weaker decoder, but does not really improve things consistently with my PK-232. On ssb, it truly does make the audio sound almost as good as local FM under many condition. The built-in AGC is a bit pumpy, and if find I get better results on voice if I don't use it. CW is great as long as you take the time to set the centre frequency up for the same frequency your receiver filter centres on., i.e., in my case 800Hz CF. With the new chip, you can vary the degree of noise reduction from the front panel - otherwise you need to move an internal jumper. If you buy one used, check on this because the jumper route is a real pain, and there are many times when you will want to adjust the degree of NR as you try to optimize SNR. Good Luck. The manuals are fine - I cannot think of anything of importance that is missing, other than some theory on DSP, but you can find that elsewhere. (Yes, I would recommend it, but I have not tried any others.)

John:
I tried emailing you to thank you for the info, but for some reason
my ISP's SMTP daemon chokes on your email address. At any rate,
the info was exactly what I was looking for, and I do appreciate it.

I do have a couple of questions, perhaps someone knows..

.. What are the low/high frequency limits for the chroma, and is the
amplitude/phase relationship linear ?

.. What is the frequency of the (subblack) sync pulse, or is it
just the 'absence thereof' ?

Also, if anyone reading this would like to collaborate on a native
Win32 SSTV app, please feel free to email me. This one's
gonna be tough !

5380. Baycom and a 16550 uart ????

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-01 00:00:00 UTC
From: michaelm@doruk.COM.TR
Message-ID: <9512011114.aa05896@bbs.doruk.com.tr>
Source record: 40241

Somewhat against my better judgement, I'm going to get back into this thread, because I've read too many comments and questions along the lines of 'BayCom (or AX25 or whatever) can't work in a computer with any other software running because it ties the CPU up in a timing loop' or 'interrupts are not important'. I'll try to contribute something that I hope will help to eliminate some of the confusion.

For some reason, there is a misconception about the BayCom and AX25 type programs - that they can't be used in a PC while other programs are running. They can be and are used as TSRs very often, witness AX25.COM, TFPCX.EXE, BPQAX25.EXE. Many people are running BayCom in a DOS window under Windows. All of these programs, and many other similar ones, are used as 'virtual TNCs' or 'virtual PADs' - they can and do work with other software running in the PC at the 'same time'. As I am writing this note, my little 386SX20 is also at work running an AX25 derivative as a virtual PAD (Packet Assembler/Disassembler) and BPQCODE as a node switch. All at the 'same time'.

How is this possible under MSDOS, the notoriously unfriendly-to-multitasking operating system? By the very clever use of hardware interrupts. UART and system timer interrupts are *everything* to a program like BayCom or AX25. If these programs had to use the CPU for 'timing' they couldn't coexist with other programs and would be practically useless.

These programs send their data to the modem on the UART DTR pin and receive on the CTS pin. They (I don't have the BayCom source code, so I can't be 100% certain of how it works - but it must work in much the same way, or it wouldn't work at all in a PC) set up the UART so that it generates a hardware interrupt each time that the Tx Holding Register is Empty (THRE), or the CTS line is seen to have changed state (Delta-CTS). When the UART generates an interrupt, it requires immediate attention from the CPU.

When it receives the interrupt (via the PIC), the CPU halts its current task and services the interrupt. If it's a THRE, the communications port interrupt service routine sends another byte out the TxData line (this is necessary for timing, not to power your TCM3105 modem) and decides whether or not to switch the state of the DTR line for the next bit. If it's a Delta-CTS, the program notes the time so that it can calculate later whether the Delta-CTS was probably an AX25 frame bit or was not, from the

regularity and pattern of the Delta-CTS interrupts. Remember, all this is going on in the PC at the 'same time' as the NOS or BPQ or FBB (or a combination of these) is running.

How is it possible to do all this at the 'same time'? It isn't! The hardware interrupts 'stop time' as far as the other programs are concerned, and if the code for the BayCom or AX25 program is well-written (it is), so that the interrupt can be serviced quickly and the CPU returned to its previous task, the other programs never know the difference.

If your computer is running AX25 full duplex at 1200 baud with NOS or a derivative, your UART is generating THRE interrupts 1200 times per second (one for each bit of output) and may be generating 1200 additional interrupts per second for Delta-CTS of the incoming data (assuming it's real data, not noise). That's a total of up to 2400 interrupts per second (or maybe more, if you're receiving noise), and the THRE and Delta-CTS interrupts are completely unsynchronized. It's easy to see that if the service for each interrupt takes more than a few tens of microseconds, there isn't much time left for the computer to do anything else. Try it on a 4 MHz XT and it will surely fail. On a 386SX20, it works. On a Pentium 'monster' it's a piece of cake: the computer is idle about 90% of the time, waiting for something new to happen.

Programs like BayCom and AX25 *don't* tie the CPU up in mindless loops for 'timing'. Most of the time, they wait in the background for the UART or system timer to generate an interrupt, so that they can do a bit of work. Programs like BayCom and AX25 *can* and *do* work on PC-type computers at the 'same time' as applications like NOS and BPQCODE. They even work in the pseudo-multitasking environment of Windows. They are able to do this *because of* hardware interrupts.

I hope this helps. 73 -

One solution to the audio (ssb) distortion problem is to use a
seperate power supply for the Kam and '850 (I did and never had a
distortion problem) ..... if that doesn't do the trick , there is a
service bulletin ASB-1000 available from Kenwood and also information
available from Kantronics that addresses the problem further.

ATV broadcasts on a CATV system ? I don't think so.
A CATV system consists of narrowband directional receiving antennes which
are pointing to specific tv transmitters in the region.

It seems highly unlikely to me that the 70cm amateur band is being received
and distributed in such a system.

However, most modern TV sets and videorecorders are capable of receiving
ATV broadcasts. But you will have to connect it to your own 70cm antenna
system.

On my ITT videorecorder, the CC 37 (Cable Channel 37) is receiving at 434
MHz.

FreeWave Technologies makes a spread spectrum modem that, depending upon conditions, might be able to meet your needs. With clear line of sight we can transmit full duplex 115 KB data over 20 miles.
Under ideal conditions much greater range can be achieved (recently a customer of ours had a 90 mile link from Mt. Everest to
Kathmandu with a 5 watt amplifier on only 1 end). The product can also be used as a store and forward repeater. Therefore,
with a combination of directional antennas, good line of sight, and a repeater or two, our product can do the job. Please let
me know if you would like some more information.

There are only two channels that would work. They are channel
59 and channel 60. Both are in the 440 band. If ATV is set up
for those freqs, then you're in like flint :-)

Just hook up your UHF beam to the CATV input and start rotating
the antenna.

However, the Kantronics TNCs are not TAPR units, hence, cannot 'change'
the modem portion...the MFJs are, and can be modified with different
speed modems. :)

On 1 Dec 1995 13:57:37 GMT Chuck Freeman (cfreeman@sound.net) wrote in rec.radio.amateur.digital.misc:

: Does anyone remember the PMP (Poor Mans Packet) interface that appeared quite a few
: years ago? If so - is this type of interface still useful today or has technology
: and packet speed exceeded its usefulness? I would be interested in using it on 2
: meter packet. Any help would be appreciated...

It is still useful. There is even an improved version of the software, called SofTNC, sold by jCom/Ramsey, that works with a Baycomm-type (serial port) modem. Unfortuntely the SofTNC package doesn't work with the original PMP parallel port modem. This is unfortunate, beacuse there are some laptops that don't work with some of the serial port modems but do work with the parallel port modem. I happen to have one such laptop.

Anyway, I frequently use PMP on my laptop when travelling. Its main disadvantage is you can't type, and you lose characters if you try to type, while a packet is being decoded. This makes it particularly hard to use on a very busy channel. But otherwise it works well.

Transmitting data over HF radio is done all the time by agencies in Aviation, Military, Maritime and Commercial. Basically the problem has to do with both regulation and bandwidth. First, the HF bands are highly regulated and you would have to get the FCC to assign you a channel, or you could become an amateur radio operator and use one of the many data frequencies available to them.

Next, the typical transmission rate on HF is less than 1200 baud. The fastest commercially available modem I am aware of is made by HAL electronics and using a special modulation scheme called CLOVER, they can attain a rate of 4800 baud, theoretically. But given propogation conditions it is usually much slower than this.

Because HF frequencies are assigned to many users internationally, what may appear to be a non-congested spectrum is actually quite busy. Therefore the channel bandwidth is narrow, giving everyone a chance to get on the air, but because of this the transmission rate for digital data is very slow, often 100 baud or less.

I would recommend that in order to get up to speed on the latest technology and to try out some ideas that you first contact the local amateur radio club and see what they are doing.

Craig

Hi,

I am thinking of getting a KPC-3 to use as a portable packet
TNC. Is this a good choice? Or is there perhaps a more suitable TNC
that I should be looking at? Also how much should I expect to pay for
one of these, both new and used (the KPC-3 that is)? Thanks.

Thanks to the many users of PkGOLD and KaGOLD, including the folks at Kantronics who beta test for us, and recommend KaGOLD to their discriminating users.

You are invited to check out our Home Page. It is about a week old, and we have had about 500 visitors from around the world.

More news and information will be posted on a regular basis. The latest is support for The Radio Amateur Callbook CD.

Have fun.

Jeff, WA4EGT

>Regards.

>Bill, W5BBR

I have since replaced the PROM's to latest version 7.1 and all is well
again and I can copy the PACTOR just fine but only with a dumb
terminal as the version of PC PACKRAT II that I have does not have
PACTOR capability except using the dumb terminal mode. That defeats
all the capabilities that a good piece of software gives that is
designed for PACTOR.

Back having lots of good contacts on PACTOR using LAN-LINK.

Regards,

Bill, W5BBR

That's news to me. The schematic I have for the KAM shows a limiter (switchable from the front panel) and switched-capacitor filters for MARK/SPACE and lowpass. No PLL anywhere as far as I can see. You can set the mark and space frequencies through software and see the correspnding changes on the pins of the SCF chips with a scope.

I think you've got the KAM confused with the 1278, which certainly does have a PLL. And as far as the PK232 is concerned, it's my understanding that its filters were "not particularly well implemented" on purpose - they were designed as a compromise so that the unit would work with 45 baud RTTY as well as 300 baud packet and all the stuff in between. You can certainly argue about whether that's a poor design, but it makes for a cost effective unit which provides reasonable performance and which people are willing to pay for.

As far as HF packet goes - I agree with you, it's a poor solution regardess of the modem design.

h-adr in Russia
To all whom it may concern.

Hello all,

The first hirarchical addressing system for packet BBSs has been adopted
in Russia.
According to this system, a typical BBS address will have the following
syntax:
callsign.XXX.RUS.EU or
callsign.XXX.RUS.AS
where XXX is 3 letters designating the administrative region (totally 89).
Special care has been taken to avoid conflicts with the ISO 3166 country
designators. This was done for the sake of some "non-standard" types of
BBS software, the FBB does not require regional designators to be unique.

The adoption was achieved by gentleman's agreement by the majority of the
country's sysops.
The new addresses are valid effective 1 Jan 1996.

>you all have points of view but I'd like to get some facts....

Let me first say that HF packet as presently implemented is inherently flawed. You aren't going to get good performance even with ideal hardware. Weak signal performance will be greatly improved if you use PACTOR or Clover instead. This will make a much larger difference than the difference between the various hardware implementations.

Ok, that out of the way, lets look at how a FSK modem works. There are two basic ways to demodulate a FSK signal. One uses a limiter and discriminator while the other uses limiterless filters and a slicer. Theory says that on a fading channel like HF, the limiterless filter/slicer approach has up to a 3 db advantage over the limiter/ discriminator approach.

The KAM is a PLL detector which is essentially a limiter/discriminator with threshold approach while the AEA PK-232 uses the limiterless filter/slicer approach. In theory, this gives the PK-232 a 3 db advantage. In practice it does not because the filters and slicer aren't particularly well implemented. Now the KAM's PLL has a lock threshold below which the PLL fails, and this too limits its ability to approach the ideal response for weak signals. So neither is particularly well suited to weak signal detection.

The MFJ1278B is also a PLL discriminator, with the addition of a DSP passband pre-filter before the discriminator. If you don't already have narrow data filtering in your radio, this can give the MFJ-1278B an advantage over the KAM+ since the PLL isn't pulled by off-channel signals. But with good filters in the radio this doesn't offer a significant advantage, and weak signals still suffer a threshold effect due to the PLL.

What we'd really like to have is a filter/slicer demodulator with very good filters and an adaptive slicer. It's possible to do this with traditional hardware, some of Irv Hoff's old designs were quite good, but it's a lot easier to implement ideal filters and slicers in DSP. There are a few demodulators available now which work this way. Note: MFJ doesn't use its DSP this way, it is only used as

a passband pre-filter. However, AEA does have DSP boxes, and HAL offers two DSP plugin cards, which can implement this ideal filter/slicer response. There's also the TAPR DSP-93 for the kit crowd, and various DSP chip manufacturers offer evaluation boards which can be programmed for this task if you want to learn DSP coding.

The only limits on DSP demodulators are the quantization step size and the digital dynamic range (basically number of bits). With the typical DSP hardware, this is going to correspond to a weaker signal than a PLL demodulator's threshold value. So if you want really weak signal performance, you're going to be looking at DSP demodulators.

Now lets come back into the real world of HF packet for a moment and realize that you simply aren't going to have a good connection with weak signals that can't dominate and take over a channel. Collisions from hidden terminals, noise hits on the long and non-FEC packets, and selective fading of the high (for HF) symbol rate are going to determine your ultimate performance. So most of this discussion is moot. Only if you want to use a more robust protocol, like PACTOR or Clover, will you be able to utilize the weak signal potential of a superior demodulator.

For HF packet as it is now done, you might as well just buy a KAM+ or MFJ-1278B. It's going to work about as well as can be expected for HF packet. If you want to use better protocols, then one of the DSP boxes or cards is called for. I've got 3 DSP solutions here, a HAL P-38, an Analog Devices DSP evaluation board, and a surplus IBM DSP plugin card (the latter two programmed by me to be filter/slicer demodulators). Any of them is better than the PK-232, KAM+, or MFJ-1278B for weak signal demodulation of proper protocols, but none of them would be better for HF packet since other factors intervene. (The P-38 as shipped doesn't even support HF packet since that's pretty much a lost cause if you need the performance you're paying for when you buy DSP.)

I sold computers at a local dealership for about a year.
We also built custom computers as well. I was hired because
I had experience building computers from scratch. In March
of '95 we picked up the PB Line and man was I amazed. We
discovered that PB was putting very slow hard drives, very
slow video cards, and other parts that were not what I would
call "current". Our 486 DX2-66 computers would exceed the
performance of PB's Pentium systems up to 75 Mhz. We also
built 486 DX4 80 & 100 systems that blew the socks off PB's
Pentium 90 & 100 systems. What gives??? Their poor
supporting hardware (HDD, HDD controller, Video controller)
seems to bottleneck what is otherwise a fantastic processor.
As far as service was concerned, when someone had a problem,
we simply exchanged the computer for up to 1 year!! We were
the #1 PB dealer in the area so we could easily make PB eat
it or drop their line!

My suggestion to computer buyers is to build your own!! If
you don't know how, find someone that does. You can then
hand pick each piece that goes into it and get a good
performance machine. Another rule of thumb I use is to NEVER
buy a computer based on the software packaged with it. It is
only a sales gimmick!

Price wise custom built computers run a little higher but the
performance advantage is worth it in the future. And by
hand picking good, brand-name parts, you'll have less service
problems.

btw...we commonly referred to the PB as our best POS (Piece of
$hit) computers!

Don, it's pretty straight forward. Connect audio in and out and ptt from Kam to 13 pin din plug on the back of the TS-850. Works fine on digital modes but I find I have to disconnect the din plug when I go to SSB. Something about the audio ground in the Kenwood not being at chasis ground. I have tried connecting and disconnecting grounds but nothing seems to work. If you forget and use SSB with the din plug installed, you will get awful audio reports but rig seems unhurt.
Hope that helps. 73, Rick rllcook@aol.com

Hi there Chuck, and having built a few of the PMP and Baycom modems they are still very popular. Most people buy a BayPac modem instead of building the one-chip modem (too much work I guess). The PMP modems used a TEXAS INSTRUMENTS TCM3105JL one-chip 1200 baud half-duplex device that supports the BELL202 protocal. Some of the earliest modems supported this mode and there-fore were prime candidates to wire-up for packet radio. At present I have a few 'REAL' tnc's kicking around now, but I sure liked using my PMP modem with the 1)TFPCX driver, 2)BPQ packet switch software running on top of that, with the 3)G8NPF PMS/BBS software running on-top of that...or optionally, the F6FBB BBS software. The NPF software was easy to setup and supported most every thing that FBB could do (without the need to wad thru hundreds of pages of docs). I just saw a new version of NPF floating around, too! For simplicity on my lap-top, I like the PMP or BayCom software. Good Luck! and 73...

Huh?

KaGOLD monitors two ports simultaneously. It is configurable to monitor different ports, or different sessions on the same port, or the outgoing data, etc.

It also has a number of other features missing from Host Master including Ansi graphics, conference mode, restartable file transfers, and yes, monitoring the packet cluster while operating on your favorite HF mode.

It also runs smoothly in Windows 95, Windows 3.xx, OS/2, and DOS.

Check the Interflex Systems HOME page

There is not a chroma subcarrier as in NTSC or PAL.

Black is 1500 Hz. White is 2300 Hz. Grays in between.
Color images are generally sent with separate scans for Red,
Green and Blue components.

Amplitude doesn't matter, only frequency.
Most systems simply use a limiter and measure the time
between the zero crossings.

>
>.. What is the frequency of the (subblack) sync pulse, or is it
> just the 'absence thereof' ?
>

Horizontal sync is 1200 Hz.
Some modes have a bit of 1500 front porch / back porch for
cleaner sync recovery. The vertical sync also has the
transmission mode encoded with bits of 1100 and 1300 Hz.

See QST January 1993 for more details.

I am looking for anyone that has been able to set up, going by the manual, the Receiver Oscillator. I am not having any luck. I have not been able to get 2.5v out of the DISC-TP by adjusting L4. In the manual it says to key the Transmitter. Does sound right? Then right under those instructions there are some for split channel operation. using a HT. Would you again key the transmitter on the MFJ 8621?

Any help would be appreciated.

Thanks Steve KD4SZK

MFJ is not in today

It should be mentioned that KaGold is a host program, as opposed to a terminal program. :)

5415. Looking for JNOS....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-03 00:00:00 UTC
From: dm5731@kestrel.fen.bris.ac.uk
Message-ID: <DJ0xBF.9B1@uns.bris.ac.uk>
Source record: 40102

Hi,

I am currently running TCP/IP, but would like to change to using JNOS as this has several additional features not supported on my version. I have looked for it on all the usual FTP sites, but what they store is generally either the source code or a version compiled for a 0/2/386.

I have downloaded the source code for version 110k and can probably compile it, but before going to all this trouble, does anyone know where I can get a version which has already been compiled for a 486? (I am actually using a 486dx2 66 if this is important).

Maybe this is a stupid question, and a version for a 386 will work quite happily, but I would be grateful for any information.

Many thanks,

Darren McNamara, G0VVO / G7RSQ

>

Yes but the header on this thread says TS850 to KAM FSK. If you do use FSK then none of the audio
feedback problems will occur because no audio connection is made to the ACC2 connector of the
TS850. The problems only arise when using AFSK.

Subject: AEA PCB-88 and TAPR connector
X-BBS-Msg-Type: P

Hello all--

Is anyone here running an AEA PCB-88? Perhaps someone has used the TAPR
connector? I am desperately seeking 2400 baud, and have seen some bulletins
for TAPR connector accessories such as a 2400 baud board, and was wondering
just how compatible they were with the PCB88.

Supposing such an accessory would work, should I connect it directly to the
board, or should I find a 20-position ribbon cable to externalize the port?

Any specific recommendations for such a 2400 baud board would also be
greatly appreciated.

5427. Pactor and PK-232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-03 00:00:00 UTC
From: erik@ve7mdl.ampr.ORG
Message-ID: <16984@ve7mdl.ampr.org>
Source record: 40114

Gary,

In your comparison of the various HF digital mode TNCs did you use a PK-232 with modified filters? I believe, the PK-232 is optimized for HF packet and may not have the best filters for Pactor.

I over the last few days tested out the P38 and find it pretty good on Pactor. However, the reception performance seems to improve slightly if I insert my Timewave DSP-9+. This is just a gut feel at this time since I do not have actual measurements to back it up.

The downside of the P38 is the software. It could be a little more robust and user-friendly. I hope some people will be creative in this area (e.g. KF7XP?).

N>However, the Kantronics TNCs are not TAPR units, hence, cannot 'change'
>the modem portion...the MFJs are, and can be modified with different
>speed modems. :)

Yes, and you can't put the TAPR firmware in them...

On the other hand, Kantronics has been adding features and improving
their firmware at a much higher rate than any of the "TNC-2"
compatibles.

Besides, the modems are pretty good for what 95% (or more) of us do on
packet, and for the remaining 5% a little hacking is no problem.

You guys keep going on about TX relay timings. That's not the
problem. It doesn't matter what baud rate the actual packet of data
is sent at once the TX relay is pulled in. It's usually delays in the
audio and I.F. sections of the tranceiver that prevent you from
running 9600 baud.

Program your TNC with the command @C # Where # is a number for the thresshold. I use @C 25 and it seems to work fine for me. To turn it off again it is @C 0. You may have to play with the number to get it right for your application. Also the larger the number the stronger the carrier has to be before it is recognized.

>>KaGOLD handles all this for you (you can override the settings but it
>>configures your system for multiconnects so this doesn't happen).
>>
>>73 -- Jeff
>>
>>Check out our web page http://www.interflex.com

N>It should be mentioned that KaGold is a host program, as opposed to a termina
>program. :)

Chris (et. al.):

I just wanted to clarify the terminology a bit.

Most of the time, when someone says "terminal program" they mean
something where you press keys, and the characters are instantly
transmitted out the serial port.

The term "host program" could mean a lot of different things -- most
standard terminal programs have a "host mode" by which they mean a
small, built-in BBS.

Many TNCs have a "host mode" which is a computer-to-computer interface
which allows a program to easily read the TNC status, easily deal with
several connections, easily modify TNC parameters.

Essentially, host mode lets the application replace the user interface
with something more powerful.

I guess "terminal application" might be the best term for programs in
this class -- the fact that they use host mode makes them different than
the typical "terminal program" but the function they perform is the
same.

TAPR has a modification to allow open squelch with many
TNCs, including the PK-88. I've built two of these, one
for my PK-232 and one for my PK-88. (I've had trouble with
the latter but I may have zapped one of the chips.) Check out
www.tapr.org.

I dont know about the transceiver, but you can use it in packet. I have one tied to my TNC via a null modem and A/B switch. I can turn the modem on, and call it (via phone) and be on packet! Works great, and I use it all the time. This is a nice set up, because you dont have to leave a computer on all the time. :)

I make TinyMUCK available on my packet BBS. I am using TNOS 2.0x
running under the Linux operating system. I have created a menu
item that allows the user to enter "muck" to connect. (It is a
synonym for "telnet mwwhost 6666" where 6666 is the port that my
MUD uses.) TCP/IP users can connect directly through the tcpgate
feature. Usage goes through cycles, but it has generally been
well received.

5441. Book on Packet radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-04 00:00:00 UTC
From: mriesche@estec.esa.nl
Message-ID: <49ujni$1bed@info.estec.esa.nl>
Source record: 40128

Some time ago I was reading a .TXT file on an ftp-site. The file
mentioned a book on Packet Radio (Cannot remember the exact title),
but it was supposed to be published in -95 and there was an ISDN number.

I'm interested in this book or any other good book on Packet Radio.

Best regards

Mats Rieschel

5442. Carrier Detect via TFPCX v1.10

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-04 00:00:00 UTC
From: cornwaab@ednet.ns.ca
Message-ID: <49ta1v$kgi@trademart-1.EDnet.NS.CA>
Source record: 40129

Hello, thanks for reading this message.

I have been trying to set up TFPCX v1.10 to make the "soft-DCD" feature work. Soft-DCD is a programmable squelch which substitutes for the radio's squelch. In my case I want to use Graphic Packet (a great program) in conjunction with TFPCX over an MFJ 8621 packet transceiver. This transceiver does not have a squelch. (I have no problem operating Graphic Packet/TFPCX/Baycom modem with an HT which has a squelch.)

Please post a reply or send me a msg. if you know how to make soft-DCD work with TFPCX. I am assuming that it can be made to work.

Thanks for your help.

: Pavillion Software Packet Cluster software?

Yep! And here it is!

****

Subject: the occasional FAQ message

To: pcluster users
From: Jim Coleman, KA6A
Re: Frequently asked questions

There are 197 subscribers to pcluster worldwide.

Here are the commands that you will find useful on this reflector

---
To send messages to everyone on the reflector,
send the message, which should always include a subject
line, to

pcluster@ux1.cso.uiuc.edu

To use the following options on the reflector, send a message to

majordomo@ux1.cso.uiuc.edu

with one or more of the following in the message body
(not the subject line!)

subscribe pcluster
unsubscribe pcluster
who pcluster
info pcluster
lists
help
end

"Subscribe" and "unsubscribe" are self-explanatory. "Who"
returns the names of those on the list. "Info" returns a very
brief description of the list. "Lists" shows all of the lists served
by this majordomo. "Help" returns a generic majordomo
help message. "End" stops processing commands, which is
useful if your mailer adds a signature. Note that there is no

SET MAIL or SET NOMAIL command.

_____
On an administrative note, users have occasionally complained that
they have been dropped from the list without warning. This only
happens if I receive "undeliverable" or related service messages
from your server. The service messages only indicate that the messages
are undeliverable so I have no way of knowing whether your
account has been closed or there is some temporary problem. Thus,
my only alternative is to unsubscribe you. For obvious reasons, I am
not able to tell you that I have done so. If you have some temporary
problem and your e-mail is interrupted, assume you have been
unsubscribed and send majordomo a new subscription request. If you
were not unsubscribed, we'll ignore it. If you cancel your e-mail account
or change providers, please unsubscribe your old address. Thanks.

If you have any questions, contact me directly.

>Darren McNamara, G0VVO / G7RSQ

Get the '386 version. Generally speaking, even if the compiler
supports a '486 compile, the difference in performance would be
neglidgeable. Also, if you're using a memory manager of any kind you
may find that 8080/8086 version a lot more stable. I sure did before
swithcing to linux, tho running a 4-port (plus ethernet) system, mine
was stressed more than most.

Has anybody ever thought of putting a paging system up on the amateur bands, for HAm to use for their own personal use. My current paging supplier is using a freq. of 148.795. pretty close to the ham bands. I am thinking of purchasing a used paging encoder and putting it up on one of the digital areas of the 2mtr band. and then buying a bunch of used pagers and re-crystalling them to this frequency. Amateurs will then be able to have the use of a paging service. One great use of this would be for the local A.R.E.S. group to notify their members of a disaster.

Does anyone have any thoughts or comments on this?

Message-ID: <818159826snz@cirrus.demon.co.uk>
Source record: 39997

Hi all,
I am uploading a new UPAK40.EXE executable file as an update to the
UltraPak 4.0 file distribution (UPAK40.ZIP).
This update fixes a bug in 4.0 where the software couldn't access six-digit
message numbers when downloading compressed messages. The sixth digit
was truncated, resulting in a "File doesn't exist" message from the BBS.
A minor bug in the ACK server is fixed also.
The update is file UPAK401.ZIP, which contains just the new executable and
a README.TXT file.
The file will be uploaded to these sites:

ftp.demon.co.uk /pub/ham/general
ftp.tapr.org /tapr/software_lib/terminal

The DEMON site usually takes a couple of days to make the upload available.

Scott (et. al.):

While a slow T/R switching time won't make 9600 operation impossible, it
does limit the effective baud rate -- if you have to run a 300 msec.
delay before you can squirt out a 50 msec. packet you will probably
ultimately be disappointed in 9600 baud operation.

> has a squelch.)

First, you should get TFPCX 2.10, the latest version (I don't know on which
ftp site it is available, but I think you'll find it easily).
Then, add @C10 in the parameters : it then should work with soft DCD on your
BayCom modem.

You can also try to use PC/FlexNet instead of TFPCX, forgetting the
digipeater side. A simple MODE x 1200c does the same job : soft DCD !

> Thanks for your help.

You're welcome :-)

> I'd like to have info on USCC board (maybe related with Baycom ? I remember
> Baycom in ti's complete name), is it available on internet ?

What kind of infos do you need ?
I'm the French BayCom dealer, so if I can help, just email me.
As far as I know, there is no BayCom dealer in Italy, according the the
latest BayCom catalog.

On the Web, you should try http://www.baycom.de

By the way, I'm using a 4 port-USCC card with 0k3, 1k2, and 9k6 modems
on-board. It works great and can be easily interfaced with any softwares :
BPQ, FPAC, TFPCX 2.10, PC/FlexNet, etc... To my mind, it's really worth using
such cards :-)

Good morning

I am looking for a packet card with a 1200 bds modem, with other
ports for future HS comm, that can work with NOS under Win 3.11 or Linux.
Of this kind, I only know the PI2 and USCC. Are there other types ?

If you have such a 2nd hand card, any offer would be welcomed.

If not, where to find it new and at what price ?

Thank you,

Jean-Francois Maion

From: "Orrin C. Winton WN1Z" <orrin@redshift.com>
Message-ID: <4a04l2$52g@wing.redshift.com>
Source record: 40140

I just posted bug-fixed versions of my Rhombic Utility
for dos (111rhom.exe) and Win3.1 (202wrhom.exe) at my FTP site.
The fix allows the program to design rhombics positioned less than
0.26 wavelength above the ground.

host: redshift.com
site: /ftp/orrin or /home/ftp/orrin (depends on what you see)
login: anonymous
passwd: your email address

You can also check my Web page: http://www.redshift.com/~orrin

There is some material of interest to digital (packet) people dis-
cussed on my page: a program (ROUTES) for extracting routing header
info from packet headers.

Thanks for reading. orrin@redshift.com

Message-ID: <4a0k5e$8kr@spectator.cris.com>
Source record: 40141

Hi Jason, Been awhile since I wired up my DJ-160 HT but I've never experienced the howling you described...strange. anyway here's the pinout for the 2.5mm stereo plug (I used a 3.5mm stereo receptacle to 2.5mm stereo plug adapter from RADIO SHACK(r) as I could not find a plug that small locally):

[RADIO SIDE] To MIC Input
STEREO
TO DJ-160 (from TNC) 2.5mm PLUG

TX Audio+PTT*------------------------>tip
+-- ring
+5v from HT *----------------------|
(NOT USED!!)
+--- sleeve
|
|
=== grnd

[TNC SIDE]

0.1uf

||
TNC TX Audio *----||-----*----->TX AUDIO+PTT
|| |
|
/
\
/ 10K ohm
\
/
|
|
TNC PTT Line *----------+
(switched to ground)

That's how you do it for th TRANSMIT side. I didn't draw the RECEIVE side. It just uses a 2-conductor (MONO) 3.5mm plug to the earphone jack. Hope that helps..and 73....drop me a packet when its playing.....

I'm trying to find either an IC or a schematic for converting
serial-parallel.

I own a solid state radioteletype decoder (circa 1980) designed
to work with serial printers. However, my printer, like virtually
all others is parallel.

Regards,

Brian Webb, KD6NRP

Brian,
Don't bother building one when you can buy one - about $90 from
Global Computer Supplies 800-845-6225.

Of course, a used serial printer at a hamfest would be cheaper than that.

You need a Universal Asynchronous Receiver Transmitter (UART). One
entirely satisfactory device I've used is a Giant AY-1013. This is
an old device and I don't know if they are still being manufactured.
If you can get one, it is easy to use in that it requires minimal
support (a clock and maybe a level converter for the serial line).

5479. TPK Corruption - Smartdrive ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-06 00:00:00 UTC
From: pete@my.home
Message-ID: <4a38hb$shu@usenet.pa.dec.com>
Source record: 40016

Hello OM's

I have been running TPK1.82 for about 9 months now. It seems to run well for about 1 month and then it screws up the priv_msg list files. It does numerous things like:

1) You try to delete a message in the priv_msg file and tpk says it doesn't exist. I have to copy another msg number onto it so I can delete it from the list.

2) I am a heavy user of Ken Robson's TPK-7 server which process's reqfil requests. I generally get about 10 hits per day which generates a fair amount of traffic. TPK HAS sent a message to the WRONG person, my Sysop who was rather amused...

I have now disabled smartdrive, which makes the 386 run like a "pig". Will this "cure" my problems, does anyone else have the same problems and is there a fix for this ????? (probably not)..

I am seriously considering switching to winpack5.13 as I have the source code to the reqfil server and it is easy to customise...

Cheers..Pete..

Kevin
First of all, congratulations on passing the test!
This radio is basically limiter to 1200 baud without modifications. You will find a lot of activity at this speed. The choice of modems is kind of irrelevant, at 1200 baud they all interoperate with each other, and they are generally standard items in most TNCs.

The four major TNC manufacturers are PacComm, AEA, MFJ and Kantronics. PacComm is the most expensive, but only by a few dollars. Their Tiny-2 is the standard of the industry. MFJ's TNCs are a little cheaper, but physically larger. Those made by AEA and Kantronics work fine, but they are not TNC-2 clones, meaning they basically have non-standard proprietary architecture, and any upgrades will cost you. You also cannot use commonly available Freeware packet networking software (Like TheNET or ROSE) in them.

The reallycheap way is a simple modem that sits on your serial port. The computer does all the TNC functions. This takes a bit of effort on the computer's part, but for a beginner, it is a cheap way to get on packet. It is called a BayCom modem, and is sold by PacComm.

Derek:

Many of the 2M rigs on the market today already come with paging built into to the rig. Some A.R.E.S and other similar organizations already use these "built-in" features. It is probably not the same kind of paging that your digital pager you carry on your belt is though.

I see two potential problems:

When you call the phone number to activate the pager who is the control operater ? You need to be a Tech. amateur license holder or higher to activate the pager.

The second problem is that in congested urban areas most of the 2M intermod is blamed on digital pagers. Many Hams that work in big citys would see this as adding to problem, myself included.

Hi Derek. I am a net control for the Central Ohio Severe Weather Net, and
we do this exactly. We have Motorola Pagecom pagers that are tuned to our
repeater freq (146.76), and wait for a tone & PL that can be activated from
on the air, or any phone by dialing into the controller. This system works
great, mainly because its on the highest profile machine in Columbus.

When the pagers are activated, they beep a few times, then the squelch
breaks and stays open, thus, you can tell if it "went off" while you ran
into the store or something. If you need more techinal info, I will be happy
to supply. BTW, you can find these VHF pagers at just about any hamfest.

hello brian,

the harris HD6402 is what you need. Its easier to use than the
common AY devices. Baudrate is externally generated. The IC is
a serial/parallel converter and vice versa. Baudrates are up to
100kBaud. I use it to serialize the AD converter output of my meteosat
converter.

Try http://www.semi.harris.com to get a datasheet. The fax infothek
really works wordwide!

If you have futher questions drop me a note!

Practically none of the 'non CPU' UART chips that were so common in the 70s
and early 80s are available anymore. You can get the same results with
many microcontrollers now, but that requires investment in tools and
programming hardware.

The easiest would be to buy a ready-made RS232 to centronics converter,
the way most favoured with the sci.electronics group would have to
be using a microcontroller. Cheap too if you're not counting the hours.

From: jkbe@zeus
Message-ID: <DJ7v6r.43M@nntpa.cb.att.com>
Source record: 40030

Does anyone know if it's possible to send a CTRL-C within a
WinPak script? This is necessary to insure to send exit commands,
stream changes, etc.

Also, is it possible to *automatically* save all connected
text into files that are named by day (ex. DEC07.LOG)?
Other programs handle this automatically and having the text
around is very useful.

Thanks,
John, WB3ESS

I can send you a copy of term2 and dterm, both work ok. You need the regular hp48-pc cable and maybe a null-modem adapter. It works! but small screen with no scrollback. Let me know if your mailer can handle MIME or if UU is better.

If what you have is a USR "AUTO DIAL 212A", it is a bit of a collectors' item. To my knowledge, it was the first modem of its era to consolidate most logic and analog functions into microprocessors. I think it had 12 chips overall, including two cpu's (8080s?) and some rom. The nearest competitor was reported to have 44 medium scale integrated and analog-filter chips. This use of software to replace hardware was extremely effective at cutting production cost while maintaining high standards of performance and reliability. USR was launched competitively with this modem. Before this, USR was producing a 300bd acoustic coupler modem that was embarassing to look at, and not as fancy as an MFJ equivalent which I had (still do). The chief designer, I believe, was Steve Muka, a talented software whiz who tragically died after several bouts with brain cancer. USR evolved from a group of computer hobbyists and pros who were members of the "University of Chicago Computer Club" of 1975-77. It disbanded when in the spring of 77 the active members decided to form companies to produce various computer pariphenalia. Of the three corporations formed that year, only U.S. Robotics survived. Stan Metcalf, a corporate charter member with a taste for science fiction, named the company. Several years later he split with USR over some conficts, and formed Computex. Look up old Byte magazine ads to compare these companies products as of about 1979-81. It shows that you can start out slow and dumb and come out a winner, or blast out of the blocks as Computex did with a ground-breaking computer that might have altered the course of microcomputing as we know it. Too bad Pascal Engines did not catch on! Yes, that dusty old U.S.R. modem did for modems what Apple did for micros. K9ZAT

Patton Electronics makes one for $89, all self contained and self
powered. You plug it into a PC, or any other RS-232 serial port, and
you get a parallel output for a standard parallel printer.

It has a DB-25 female serial input, and a 36 male centronics for
connection to the printer. It is all self contained on a 6 foot cable.

The model number is 2023, and they are at (301)975-1000 (Gaithersburg,
Maryland)

I know that the newer rigs have the ability for paging, but it is not
personal paging. I would like to put in a full alpha/numeric paging
system for our local hams. They could then pick up used pagers on the
market, convert them to 2mtr freq. and have they use of them.

> When you call the phone number to activate the pager who is the control
> operater ? You need to be a Tech. amateur license holder or higher to
> activate the pager.
In VE4 land you need to be an advanced operator to have the licience on a
repeater. My idea is to put the pager system on the same freq as the
local autopatch. This would be then used simular to a reverse autopatch,
just with out anyone replying back.

>
> The second problem is that in congested urban areas most of the 2M
> intermod is blamed on digital pagers. Many Hams that work in big citys
> would see this as adding to problem, myself included.

Ture but we would only be using about 25 watts compared to 200 watts for
the comerical guys.

the idea goes something like this:
use the autopatch frequency, install a 286 computer with one of these
new fanct fax/modems that allow for voice mail boxes on the hard drive.
(the Zoltrix for example) These new modems also will talk to paging
systems and will pass on a message from the voice mailbox to a pager (or
at least activate the pager). The ham will then get a page and will use
the autopatch to pick up his message. While the orginator of the message
will not neccessary be a ham, it is the same as passing third party
traffic, or using a reverse autopatch. The transmitting will only be
intened for licienced hams. Another example, A ham puts a pager on his
daughter's belt, she goes to the local playground. it's dinner time and
the ham calls the autopatch and has his duaghter paged to come home. This
case it's a ham activating an ham station and sending out digital codes
that no one responds to, but his daughter still comes home for dinner.

As long as proper monitoring is done to insure that no business traffic
is passed, there should not be a problem.

I have seen paging encoders (used) go for about $20.00 CDN, and used pagers for $10.00. new pagers $90.00. But then again to subcribe to a commerical service is $15.00 per month or $180 per year. This will not add any time to the autopatch freq. as it will only page when the autopatch is not in use. Most people do not monitor the autopatch freq anyway, but only go to that frequency when they need to make a call.

You can buy on of those little 10 gig transmitters at any hamfest for
about $20.00. It runs on 9vdc, and is a lot of fun by itself!

To 'confuse' a radar reciever, add a switching transistor to the power
side, controlled by a pot, to make it osscilate the feed.

Think of the fun when you go by a cop at 25 mph, and he sees 110 mph
on his screen! :)

>jamming device that really works?

There were some articles a while back in Car and Driver about how to
build a radar jammer.

The physics involved in building a laser "jammer" would make it a
challenging project, indeed! About all you can do would be to defeat
the laser by fully absorbing the energy (no reflection) or scatter the
laser reflection to such an extent that the receiver couldn't find the
return. If you figure out how to actively "jam" a laser, there are
some folks at the Pentagon that would probably enjoy talking to you...

Thanks much,
Herndon Elliott

Chris and Derek, Yes indeed I have given a great deal of thought to paging in the amateur service for ARES and personal contacts as well. My thoughts are not to use the VHF's however. Here in rock and roll Central California some lower frequency seems far better, especially when mountainous areas are involved. First thoughts were 80 and 160 meters for this. It then became apparent that not all activity was amateur related and much of that activity involved the use of codeless hams. Experiments are now going on using BPSK at one baud (that is one character per second) in the 1750 meter experimenters band. No license is required regardless of the amateur activity. It seems to me that this is the only reasonably competant way to get messages out of the local area when extended damage occurs! 73 Cliff Buttschardt W6HDO

5517. Re: HP packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-08 00:00:00 UTC
From: hudson@cs.tulane.edu
Message-ID: <4a8fsc$sm8@rs10.tcs.tulane.edu>
Source record: 40054

(I've lost the attributions somewhere. Please forgive me!)

> I have heard that it is possible to use an HP-48g(x) calculator as a
> terminal for Packet. My primary interest is for a light packet station to
> take backpacking. I am looking for plans for the necessary cable from the Hp
> to the TNC and the software needed to interface the two (I have the 48G).

I currently run packet via a KPC-3 and HTX-202 with my 48gx. It works
well, although there are several problems that I have been unable to
rectify:

- Small screen

I heard that there is a new vt100 emulator for the HP that
will handle a virtual 80x25 screen, but I have yet to see it.
The best I can do right now is 33x16 (I think), upper-case only.

Additionally, the emulator can not handle all the VT commands,
so it is only usefull in line mode. No raw or cooked programs
for you!

- Slow refreshes

Even though the port is capable of receiving at 9600, I am not
satisfied with the speed of drawing the characters on screen.
A single line of text may take ten seconds! This is by far the
most frustrating aspect.

- Short battery life

Using the serial port continuously sucks the batteries dry.
Better have some form of backup battery for extended trips --
how do you plan to power the calculator?

- Extended typing is difficult

No discussion here. I don't know anyone who is faster on
the 48 than a real QWERTY.

For line mode only applications (e.g., most packet BBS's), it works
well. I use mine to log into an interactive shell on a Unix machine, so
my requirements are very different from the standard packet user.
It is a thrill to show people that I can browse the web and read my
mail via my calculator while in class.

My next project is to buy an older Newton and write an AX.25 stack
for it. It has the I/O speed that I need to format the packets and
decode them as they arrive. I've heard that it can't reliably scroll

faster than 2400 baud, but the packets don't arrive that quickly.
Does anyone have experience here?

Best of luck,
Tramm

Yes you can use a kpc-3 and the hostmaster Mac program. A tnc and a plain old terminal program such as Zterm will work also. The Hostmaster Mac has the details for hooking up the radio and other stuff that you will need to know in it. 73-Jon Peterson N9OUM

Hello,

I wonder if anyone has successfully attached an external modem to
the old style Baycom 4 port USCC card port `2' - which is the one
with just a modem connect header.

When we use Baycom 1.5a software to put the port into transmit, the
RTS line from the SIO goes active, and stays there - it will not come
out of transmit.

Have any other readers experienced this trouble ?

Cheers,

Gareth.

unless it deals with amateur radio topics only. See for yourself
by reading pages 6-6 and 6-7 of the ARRL FCC rule book, 9th edition.
This was pointed out to me by a local ham when I noticed he didnt
carry the following echoes:
HUMOR
AGAP
(er... AGAPE)
DEBATE
among others. His killfile must be pretty big. When asked why he
didnt carry HUMOR he replied, "because it is illegal", then cited
those above pages.

WOW! He is right! But for many years now I continue to see the echoes
and have yet to hear of a single FCC slap. So I conclude its one of
those unenforced rules. Would love to hear your comments...

it's very regulated

>and b. can bend over the horizon.

true, but due to multi path propagation your maximum baud rate is pretty low
unless you are frequency agile and operating close to the MUF. 1200bd is about it.

VHF through microwave is needed for this sort of data rate, 56kb modems are
available for this for about $300 (I think)

>
>Does anyone know how possible, leagal and/or expencive is this project?

Well everyone wants one of these. They are starting to be off the shelf but
they're expensive in the kilo$ region I think. There's things like
personal computer communicators which send RF around a building at about
900MHz and if you put an antenna on them they go for about 2 miles.
I understand that companies have developed stuff at about 2-5GHz to do the same
thing. I'm hoping that ham packet will all go over to this sort of stuff
so we can have ethernet data rates on 10GHz.

Brian Webb (102670.1206@CompuServe.COM) penned:
: I'm trying to find either an IC or a schematic for converting
: serial-parallel.

: I own a solid state radioteletype decoder (circa 1980) designed
: to work with serial printers. However, my printer, like virtually
: all others is parallel.

: Regards,
: Brian Webb, KD6NRP

Most printers around that time were serial. There are still many old
printers that are serial. And believe it or not, most of the printers
made today are serial.

Well that's a bit of a fib. Most of the printers, like LaserJets and
DeskJets, have both serial and parallel ports. And you could use either
one on the newer models. They switch automatically between the two ports.

The computer stores like Fry's and MicroCenter sell a serial to parallel
box for around $40 US. You can often pick up a cheap buffer box that
will do the same for a few dollars at a swap meet.

You should check to make sure that the box you get can be set to the correct
baud rate. Some of the older stuff may run at very low baud rates, and
most stuff today runs at 1200 bps or faster.

Erik,

The TS-430 should work fine. Mine does. It will also handle AMTOR
which has even shorter ARQ packets.

Depending on the TNC you have, you may find timing parameters to
adjust the time between PTT and sending AFSK tones, which may be
called ARQDELAY.

I've done considerable testing on AMTOR, Pactor, and
was part of the G-TOR testing prior to its release, all using my
TS-430. I have an FT-990 as well, but use the TS-430 for testing
because I assume if something works on my TS-430, with it's standard
IF filter (2.4 Khz) and no modifications (like defeating the slow AGC
which helps) it should work on virtually any reasonable radio.

I am not sure exactly what you want but if you are wanting to
access you tnc via the telephone simply use an external modem
(and old 1200 baud will do fine). Set it up in the Auto answer
mode and connect serial port to serial port on the tnc with a
nul modem cable. Then you can call it with any communications
software. I did this in the past and used Procomm to dial it up
then once I accessed the tnc I switched to Yapp. One really
needs an unlisted number to do this due to unauthorized access,
but I guess there may be a method of using a password.

Erik...Look carefully at the schematic and look even more carefully at
the actual TS 430 PTT line. There is a 0.47 ufd cap on the schematic
and usually a 4.7 ufd cap installed! In each case this should be reduced
to about 0.1 ufd maximum! Use a 500 ohm resistor to ground as well as
this will reduce the transfer time to something acceptable. Cliff W6HDO

I think you guys are the reason Ham radio is a failure today. There's too
many wanna-be's, and not enough people that actually create worth.

Your logic is juvenile, and incorrect. There is no rule that says you can't
have fun. There is no rule that says anything about restricting your
activities in Ham radio. All the FCC cares about, is that you have a
technically competent intallation and that you not interfere with other
licensed users. There are some restrictions on emissions, but these are
modulation, not content. The only thing the FCC will not allow for content,
is encrypted communications. They don't give a shit about your fucked up
BBS. You guys should find another hobby, and quit ruining it for everyone
else. Anyone who reads the rules in such a restrictive way, is an asshole
of the highest degree.

We've contemplated doing the same sort of thing up here. I've got an old Minitor pager xtalled up on our local repeater which can generate 2 tone paging. With the repeater doing the paging, only a licenced amateur can set the pager off. A licenced amateur is in control at all times. The other benfit comes from using the Minitor pager. It allows the repeater to be monitored.

I'm not sure what you mean by 'personal use'. Seems to me that if it's not an amateur related page then you should be doing it on a commercial freq. If you plan on phoneline control what about non-amateurs controlling the paging transmitter?

Steve

I'm not sure what you mean by adding to the problem. It's usually the higher power of the paging transmitters mixed in with a very congested RF enviroment that causes intermod problems. Adding a transmitter into the ham bands would cause as many problems as adding another repeater or packet node. I'm sure most amateur repeaters are run at less power than most paging transmitters.

If your worried about intermod getting into the pagers then you don't have to worry too much. Most commercial gear is far better at keeping out intermod than amateur gear.

Steve

5554. DJ-560T on PKT??

Like Kevin I am also looking for a TNC. I know little about packet but I have come accross the Pac Comm Sprint-2 TNC in the Tucker catalog (most recent issue).Price $219.00. Some things confuse me: "modem filters configured for 9600 baud" - to name one. Can anyone explain this to me? What is PacComm firmware including PMS - by the way? I will definetely use linux to get on packet. I am located in Brooklyn, NY. If anyone could direct me to the source of information, please.
My radio is an HT: Kenwood th-79A(d) - dual bander.
Is the TNC capable of 1200 baud right from the box? Is my radio capable of 9600 baud?

Thank you for your patience if you answer.

5557. Re: Packet Mail to ALLUS is illegal

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-10 00:00:00 UTC
From: Rob Wedlock <ki7mh@delphi.com>
Message-ID: <BNCGkTY.ki7mh@delphi.com>
Source record: 40087

First of all, let me state the source of this all: I noticed that KD7BN, a PBBS in Riverton, Wyoming (I live in Casper, Wy) does not carry (among others) YL, HUMOR, DEBATE, and AGAPE. Curious, I asked him why. His reply: 'It is illegal' and referred me to pages 6-6 and 6-7 of the 9th edition of the ARRL guide to the FCC rules. Thru further private messaging, I discovered not only was he killing them from his board but also from forwarding them down the line.

Let me make public my deep disquieting at the state of affairs this would provide. Packet radio existing solely for the purpose of discussing packet radio gives me a tremendous case of existential indigestion. It seems to me to be on the order of people making contacts simply to exchange call signs. I do not like it, but after reading the citations he referred to, it seems to be completely true.

Observe: (starting on page 6-6)

Q&A "ALLUS" and "ALL" Packet Mail

Q. Does the FCC consider packet transmissions addressed to "ALL" or "ALLUS" as one-way transmissions, or are they two-way communications ina big roundtable of packet stations?

[Ed: or are they none of the above?]

A. In a letter issued June 8, 1993, by its Personal Radio Branch, the FCC said "Information bulletins addressed to 'ALL' or 'ALLUS' are permissable, if that means they are for all amateur stations or all amateur stations in the United States. If such information bulletins, however,are intended for all persons or all persons living in the United States, they are not permissable because that would constitute "ALL" or "ALLUS" messages to be messages that are NOT addressed to a particular station, and accordingly, fall into the category or one-way bulletin transmissions.

Q. Does this mean the FCC will consider "ALL" or "ALLUS" messages that are not of direct interest to amateurs to be violative?

[Ed: should the FCC determine what the FCC thinks?]

A. The FCC feels the rules are clear that the information bulletin must be directed only to amateur operators and must consist solely of a subject matter that is of direct interest to the amateur service. In other words, the sender must want to information bulletin to be received only by amateur operators. Further, the content of the information bulletin must concern a topic that is in some way related to, or connected with, the amateur service so that it fulfills the requirement

of "direct interest" to the amateur service. (End of copy)

To copy another part of the pages:
There is no room on the crowded amateur high-frequency bands for lengthy one way transmissions on a regular, quasi-broadcast basis. [Ed: only just enough room for ARRL bulletins?] Information bulletins by definition must be confined to factual matters, not matters of opinion. The must be intended to inform, rather than to entertain. (End of copy)

Thoughts:

1. Anyone ever been fined for posting a recipe to packet mail?
2. Broadcasting is putting your station in unproto mode.
3. There is never more or less than a two way connection anywhere in packet radio.
4. Cant it be thought of as a huge net? Maybe we can have all packet users officially 'check in' to the HUMORNET!
5. Is this akin to the CW-test prevent ham from becoming CB? (i.e. No entertaining messages prevent packet mail from becoming usenet?)

Lets figure something out here, folks. Please lets hear your thoughts.

Look up WD1V. He maintains a database of Mac users. There are a few
good programs out there. One that comes to mind is Savant, a full
featured packet terminal. Also look for MacNET, a version of NOS for
Macs. WD1V has the information...

I have successfully used a Mac and a PC to run my PK-88. I use the computers as dumb terminals with local disk storage, so I don't have the problems that may be encountered with so-called packet software. I use procomm on the PC and ZTerm on the Mac as the communications software. Zterm has a nice feature that keeps a running buffer of unlimited size. You can also elect to send everyting to disk. I used a Mac SE 30. In addition to the Mac, you need a modem cable and the PK-88.

5566. TFKISS & Win95

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <30CCFF61.5581@en.com>
Source record: 39963

I am just about ready to take the tech test and would like to get into 2 meter. I'm in sales and spend a lot of time on the road so I would like to go with a mobile unit. I have a a few questions regarding this.

1st. In the general opinion what is the best buy, best rig etc for a mobile to meter unit.

2nd. I would like to take the unit inside with me on the off hours to keep up with the hobby. Does this limit me to hand held? If so what are the good buys when it comes to hand helds?

3rd. Ok I lied, this is a 6 meter question. They don't make 6 meter unit for mobile do they. What are some of the better units out there for the 6 meter band?

Thanks in advance for your help.

Sounds like one-way broadcasting to me. Not sure if that's legal in
Canada. Something like this would be best stuck on a business band with
you paying the applicable fees. Paging out other club members for amateur
purposes is probably ok. Sounds more like somebody trying to save money by
putting a paging system on the amateur bands.

Sean,
Buy the PK-232 modem disconnect header retrofit kit from TAPR (www.tapr.org)
for about $20, and then you can use whatever Modem you'd like, such as the
NB-96 from PacComm, a licensed G3RUH modem.

Sure, a '232 will do 9k6 as well as anything. A little expensive, if you have
to buy one, but once you have it, certainly reasonable.

Sorry I missed the fornt end of this thread, so I don't know exaclty what you need but the 74xx299 is a 20 pin parallel in and out universal 8 bit shift reg. It should do the trick. Tons of other options as usual. Since your going to have to write a driver, you might want to use a microcontroller with a serial port to make you box look like some other modern device that is supported by whatever software is going to be talking to it.

Sent at: 15:58 EST 11-Dec-95
Subject: One HF data transfer

I need to set up a one-way data transfer system on HF. The possibilities seem
to be AMTOR FEC, ASCII, or RTTY. I'm most comfortable with RTTY and could set
up simple receive links that way. Two-way for ACKs is not possible.

What type of interface/TNC is most reliable? The sending side will not be
easily accessible. What programs would allow different commands to be run at
pre-set times? Does anyone else have experience in a similar setup?

Your ideas or help appreciated.

de Daniel

: software or a tnc, You can never talk to your yl and ask her what is for
: dinner, you can't tell someone your occupation because it isn't ham
: related either,etc.... You get the point don't you LID. I run a BBS
^^^

: here and guys like you don't know the first thing about rules and regs.
: We had a local here that tried to tell me once that a bulletin on my BBS
: where a fella was trying to sell a 10 foot satelite dish for 50 bux was an
: illegal message because it wasn't ham related. Never occured to him that
: maybe someone might want to try and set it up as a Transmitting antenna.
: There is alot of stuff sent out to ALLUSA that needs to be kept to
: a local level. Just because a SYSOP of a BBS says that this is wrong
: doesn't mean it is. I am sure there is a BBS association or group that
: can clear up your mind on this matter or better yet just get back on
^^^^^^^^^^
: 11meters so you don't have to worry about rules and such.
^^^^^^^^

Amazing how people without a good argument always resort to name calling
and other slams. In case you didn't bother to read the previous posts
too well (you DID read the whole post, didn't you?), their thought is
that a bulletin sent to ALLUS is like a broadcast, thus it must relate
to amateur radio subjects. This has been discussed in great detail
many times before. I don't know what my own opinion is on it, and it
probably doesn't matter. But if you, mister N9QPI, can't discuss the
issue without the tone you use above, then please just go back to your
computers and forget about amateur radio.

Source record: 39977

(1) This is a VERY difficult question to answer, none of us are objective. For new units Alincos are generally very competitive price wise. Yaesu, Icom, and Kenwood are all very close in features.
I personally would suggest you consider a dual band unit including either 2 meters and 440 or 2 and 220 MHZ. You will find HUNDREDS of 2 meter repeaters that you can key up all over the country but few will produce responses as you give a call coming through town. 220 and 440 are even less populated but at least these bands have remote bases and phone patches much more so than 2 meters. These allow you to operate everything from base-station quality 2 meters as well as access to many other amateur bands of interest.
Here in NM we have several such remotes that allow public access to HF SSB & FM (from your FM transceiver), 2 meter FM, 6 meter FM, as well as UHF linking to other wide area systems, as well as phone patches and other bells and whistles not normally found on 2 meters. Most are open systems, though you will usually have to track down a sysop to provide you will command lists etc.
(2) Portability is up to you. An HT is easiest to carry in and out of the mobile setup but mobile radios can be set up with "quick disconnect" connections that allow ease of transfer between the office/home and car too. An HT is most portable and most easily set up in different situations (battery comes along right with the radio etc) but they are also most limited in power output and receive selectivity. If you live in one of the larger metropolitan areas with lots of commercial 2-way readio activity you will find mobiles have better filtering which will make your ham operations much more pleasant to your ears. Also many repeaters require more power from YOU than the typical HT can provide so often an external amplifier is needed.
(3) SURE they make mobiles AND HT's for 6 meters. They may not be nearly so plentiful as 2 meter equipment but Azden, for one, makes very nice 6 meter HT's and mobiles and Icom and Kenwood both make 6 meter mobiles though no HT's so far as I know.. since the 6 meter market is much smaller (since Novice enhancement or addition of 10 meter SSB to Tech privileges--before novice enhancement 6 meters was the lowest freq a Tech could operate on so it was much more occupied with Tech DX'ers) and it is STILL an interesting band to operate. It usually is quite deserted, however, unless and until the band opens up with "skip" when everybody comes out of the woodwork.

If you have an active local 6 meter group and maybe a repeater
6 will be much more useful for you during the non-skip periods.
Since there are so few mfr's "doing" 6 meters the "best"
question is sorta moot. They are all comparative in quality &
performance so far as I know (never owned a factory-built 6
meter unit, all mine were surplus conversions or homemade).

Have you not found the newsgroup news:rec.radio.swap yet??
Lots of used (and occasionally new) ham gear there....
sometimes even cheaper than new prices!!
The radio shack units are good radios but the prices are
usually a bit higher than what you can get by calling a few of
the 1-800 ham dealer numbers in every ham magazine. But, their
stores are usually a lot farther away than your corner radio
shack in the event yours stops working, not that RS can fix
your defunct unit but usually they will just exchange it for
another unit if it is new enough. Also RS has occasional sales
which make their ham rigs REALLY attractive pricewise. I've
seen the HTX202 on sale for as little as $150 new and I believe
the HTX404 440 HT is on sale for $225 or so even as we "speak".

I have been running KA-Gold since its introduction. It is, without a doubt, the finest multi-mode software available. I tried KA-WIN but found it lacked many of the kagold features and was more difficult to use.

Unlike Stan, I don't have a vested interest in the software I recommend.

Hello OM's

I'm interested in incorporating PGP into my e-mail messages. There appears to be some "scum" here that takes great delight in using other Amateurs callsign's to flame others.......

I am getting a server from Roger Barker (Winpack v5.13) to incorporate PGP into his BEAUT packet program.....

What I would like to know, are there any servers written for packages like TPK, TSTH etc etc that would incorporate PGP ?? Any info would be appreciated !!!!!!

Thanks..Pete..

Ka-Gold has proven itself to me to be the BEST multimode program for the KAM+. It has been reliable, is easy to use, and operates flawlessly under DOS or Windows. I've tried almost every one of the competing packages & always returned to 'Gold. The others don't ever seem to approach the simplicity and power of the Interflex Product.

The only problem is that it costs $$. I think over time, I've invested more with Interflex for upgrades, etc, than with Kantronics :^)...

I also use Ka-Gold for a lot of HF digital work. It is very easy, plus the multimode/multiband features of the package allow me to keep an eye on packet clusters or local traffic while playing on HF.

Good luck & enjoy.....

>FCC said "Information bulletins addressed to 'ALL' or 'ALLUS' are
>permissable, if that means they are for all amateur stations or all
>amateur stations in the United States. If such information bulletins,

If it's on packet which is accessable to hams only this makes this an easy
answer.

>bulletin must concern a topic that is in some way related to, or
>connected with, the amateur service so that it fulfills the requirement
>of "direct interest" to the amateur service. (End of copy)

Remember that hams do lots of things from public service to helping kids
during the holidays. This covers almost every topic available from humor to
construction, and even receipes that hams like.

I think the key point that needs to be said again is that a ham can do
packet on our frequencies and not the general public, therefore any
transmission is by default directed towards hams.

TFKISS isn't DAMA compatible ? Strange ! Have you tried P255 ? As far as I remember, TFPCX (the old driver) needed this parameter to switch into DAMA-slave mode.

You could also try to use PC/FlexNet without activating the digipeater function, but I wonder if it is really that efficient under Win 95.

> Is anybody know how to use WinGT (great paket soft like GP) with PK232
> ???

Read the German manual :-) It is explained how to use TFPCX in KISS mode (you have to run the parameter icone and change the COM number, but I don't remember more). I used to run WinGT on a KISS link : it worked perfectly well.

To conclude, if you need a real KISS program, what about using XPR4WIN developped in Austria ? It is available on the main German BBS, such as DB0GE-8, in the RUN EL part, and also on the internet (search !PR4WIN.EXE).

No. Not true. Any terminal program can be used with a Kantronics TNC
just the same as with other brand TNCs. However, I find the command
syntax for the KAM to be much harder to learn and memorize than for
the AEA PK-232. But either is easy on a packet only TNC.

Pictures of the Spartan 206 OAST-FLYER spacecraft which will carry the
Spartan Packet Radio Experiment (SPRE) in early Jan. 1996 are now online at:

http://sspp.gsfc.nasa.gov/sp206.html

SPRE is a 2m packet "easysat" which will be a test of the usefulness of
real-time downlinks of space-based GPS positions as well as using APRS (tm)
systems to digipeat terrestrial locations through LEO spacecraft.

The Spartan 206 spacecraft is a free-flier which is deployed from the
Space Shuttle payload bay during mission STS-72, and left on its own for about
46 hours. After that time, the Shuttle picks up the Spartan and returns
it to earth.

For more information on SPRE, go to WWW URL:

http://w3eax.umd.edu/spre.html

Yep, in fact I got mine working with a HP-95LX when the 95 came out
and recently swapped cables to work with the 200LX (I was out of the
packet stuff for awhile.)

Mine works fine -- I could fax you a drawing of my cable connections and
discretes used if that helps.

As for the Handi Packet -- I have been using the 1.6 rev and recently
upgraded to 3.x? -- have not gone back to try it with the 200 though.

The KPC-3, KPC 9612, KAM, and KAM Plus will run on any terminal program,
even the lame 'terminal' program that comes with Window 3.x.

I have never heard of any Kantronics TNC that couldnt be ran from a
standard terminal program...could be wrong...but I know the above TNCs
work fine. :)

Not true while there are some advantages to "host" mode
it is in no way necessary for most users. I have used the
stupid little terminal program in Windows to run and mostly
reset all of my Kantronics boxes. A new one comes with a
small minimal terminal program and there are a multitude of
shareware and freeware offerings out there. The Kantronics
boxes are nice small well made TNCs between satellites and
my new node I have about 7 of them now.

5617. PK-232 to Kenwood TS-850

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-13 00:00:00 UTC
From: wi3z@omni.voicenet.com
Message-ID: <wi3z.2.30CE2F5F@omni.voicenet.com>
Source record: 39908

I just got a TS850 and hooked my PK232 to it via the 13 pin acc. plug in the back. The problem is that every time that I go to SSB, with the PK connected, I get garbled audio. I have to unplug it to get the thing to work properly. Anyone have any ideas on correcting the problem.

Thanks
Al WI3Z

68HC11 with embedded Forth. Takes about 10 lines of Forth. Has
serial port. Has parrallel port with centronics printer support logic.
Awesome little chip.

Just two years ago I replaced the 1013 in my Radio Shack TRS-80 Model III.

They are still rather easy to obtain.

If you use FSK then there is no problem because there is no audio connection made to ACC2

Hi!
From what I've read in these groups, Kantronics TNCs require special software to run, that they don't use just standard terminal programs. Is this correct? All Kantronics, or just certain ones? I'm thinking about getting into packet, but don't really want to spend more than I have to.

Thanks!
Russ KI7FL

Russ,

Kantronics Tncs with a simple terminal program will do anything most other Tncs
will do. The reason that you read so much about Host Mode programs for
Kantronics Tncs is that these Tncs are capable of so much more than a simple
Tnc when coupled with Host Mode software. Go ahead and get your feet wet with
your terminal program, but don't be short-sighted and settle for a simple Tnc
if you think you're going to save money that way. The digital modes are habit
forming and you will quickly make use of the expanded capability of a more
sophisticated Tnc. That's just the way us hams are made, don't fight it ;-)

>from a Kam Kagold is the ONLY way to go....73

Tnc support software are much like word processors and a few other catagories
of software - ya like what ya know. KaGold is the leader in DOS software for
good reason - it's good software. I should know, as a KaGold licensee
dating from the first version.

As long as a DOS application meets your needs, stick with it. I have no
interest in evangelizing for Windows. But, if you have decided that Windows
will be your platform, then KaWin is the only software that takes full
advantage of both Windows and the Host Mode interface of the Kantronics Tncs.

KaWin is not as full featured as KaGold - yet - but, it's catching up fast,
with many new features added since the initial release in April. And, NO KAWIN
USER HAS YET BEEN ASKED TO PAY FOR AN UPGRADE!

BTW Lee, you'd like KaWin a lot more if you'd register it ;-)

I have two KPC-9612's on the air, one running as a NETROM. The TNC's are great. The only problems that I have are finding raios that are really 9600 Baud ready. Alignment of whatever radio you choose is important. We resorted to buying AEA's Deviation meter to align our Kantronic TNC and radios. It was well worth the cost.

We are running ALINCO 1200TH2's, a YAESU 736, 2500's and
ICOM 281's here in Minnesota. I was also suprised to see how well the new little rockbound MFJ transceiver will do. If you experience intermod just use a cavity filter in front of the MFJ. Path is critical for 9600 so be prepared to put better antennas higher and running a bit more power for long links. Hope this helps

You also might want to try the HP95LX. The 512KB model will run you about $75.00 and it's a great little computer with a VT100 emulator. It opens up as a clamshell revealing its qwerty keyboard and 240*128 pixel screen. It sports a NEC V20 CPU and a bunch of apps, including Lotus 123 and great communication ability with it's IR and serial ports. The new HP100/HP200 are better but more expensive. BTW, the HP95 does 40*16, and the HP100/HP200 do 80*25 (cga).

I have both a HP95LX and HP48G. They even link over the IR port (2400baud) and it makes for quick backups without cables.

: > to the TNC and the software needed to interface the two (I have the 48G).

: I currently run packet via a KPC-3 and HTX-202 with my 48gx. It works
: well, although there are several problems that I have been unable to
: rectify:

: - Small screen

: I heard that there is a new vt100 emulator for the HP that
: will handle a virtual 80x25 screen, but I have yet to see it.
: The best I can do right now is 33x16 (I think), upper-case only.

: Additionally, the emulator can not handle all the VT commands,
: so it is only usefull in line mode. No raw or cooked programs
: for you!

: - Slow refreshes

: Even though the port is capable of receiving at 9600, I am not
: satisfied with the speed of drawing the characters on screen.
: A single line of text may take ten seconds! This is by far the
: most frustrating aspect.

: - Short battery life

: Using the serial port continuously sucks the batteries dry.
: Better have some form of backup battery for extended trips --
: how do you plan to power the calculator?

: - Extended typing is difficult

: No discussion here. I don't know anyone who is faster on
: the 48 than a real QWERTY.

: For line mode only applications (e.g., most packet BBS's), it works
: well. I use mine to log into an interactive shell on a Unix machine, so
: my requirements are very different from the standard packet user.
: It is a thrill to show people that I can browse the web and read my
: mail via my calculator while in class.

: My next project is to buy an older Newton and write an AX.25 stack
: for it. It has the I/O speed that I need to format the packets and
: decode them as they arrive. I've heard that it can't reliably scroll
: faster than 2400 baud, but the packets don't arrive that quickly.
: Does anyone have experience here?

: Best of luck,
: Tramm

This sounds like a great deal of overkill to me.

serial-to-parallel: isn't a UART what is desired? Maybe a couple
more chips to generate strobe pulses, and a crystal; but that should be about
it.

Cheers,
Phil

It would most definitely not do the trick, at least not without large
amounts of support logic. The original post was about asynchronous
serial transfer. It can be done with the HD6402 as mentioned, but it
will take a few extra chips to go along. A microcontroller with onboard
PROM would probably give the lowest chip count, but you need some tools
that not everyone has available (compiler/assembler, device programmer).

The 6402 is also suitable. This may be pin compatible with the AY-1013,
and is definitely still available. You can choose parity/stop bits etc
by hard wiring various pins high or low, and it will run up to 100Kbps.
This version needs a clock input, but there's also a 6403 which has a
clock generator built-in so you can just add a Xtal.

N>Thanks!
>Russ KI7FL

Most* TNCs available today will operate well using "command mode" and a
standard terminal program, such as Procomm, QMODEM, Telix, etc.

(* Most because if I say "all" someone will turn up with one that
doesn't -- I can't think of one offhand)

Some have an additional mode -- HOST MODE -- which allows more
sophisticated software to be used which adds significantly to the
overall functions of your packet system (making it easier to monitor
while connected, handle multiple conversations at once, "conferencing"
and the like).

While you may not want to purchase host mode software right away, you
should look for a well-supported host mode as one of the TNC features:
it does not add to the cost of the unit, but it does give you more
options.

The Kantronics units do have a host mode, and in my opinion offer the
most bang for the buck.

Hello

I run the local PBBS for the local radio club here in the county. The club would like to set up something on the bbs to pass information to club members who use the bbs. Is there a program out there that will be able to send a copy the newsleter and other short notics to the club members. I have look at the carbon copy programs but is there something else beside that.

I've used a 9612 for over a year without a single problem. I am using
a Motorola MVP for the VHF radio (1200) and a Yaesu FT5100 on the 9600 side.
We don't have much 9600 here, but what there is seems to work fine. The
TNC and radio are on 24hr/day and there hasn't been a single glitch

Since the laser speed guns have to be aimed using something
like a rifle scope, just set up an infrared sensor to turn on a BIG
carbon arc lamp. It won't jam the machine, but it's tough to see
the numbers with all those spots in front of your eyes.
Now none of my cop friends will be speaking to me.

Hi all.
I am looking for a circuit that would be an active equivalent to the diode matrix used for interconnecting NetRom type nodes.
I recall seeing something on this several years ago, but cannot seem to find it now. It may be that there was someone selling circuit boards or something like that. If you know of a source for such a device, I would appreciate a return message.
I can be reached @ any of the following:
robd@netshop.net
rdover@cariboo.bc.ca
102133.2357@compuserve.com
ve7eje@ve7rxd.#scbc.bc.can.noam

Thanks and Seasons Greetings to all.

That's what I said, wasn't it. The 6402 is a UART, I just pointed out
another option that might save a few chips. Please note that most UARTs
would require a processor both for setup and for data transfer. The 6402
and a few others don't, all setups are done by tying pins high or low and
there are separate 8-bit parallel buses for transmit and receive.

: jwedgeco@unccsun.uncc.edu
: hamm-wanna-be

Jason,
If you're concerned about operating packet, don't worry, it's everything
ok up to 1200 bauds, sometimes it's possible to operate at 2400 bauds with
any mods, but I've never done that on an HT.
About the baycom modem, it works great up to 1200 bauds and the price is
very affordable. I'm sure you will be able to find one as a kit with al the
components and PCB or any one can give you the shematics and you can build
it by your self, if not you can contact me and I'll send you the scheme
attached to an e-mail. I dont have it here so I can't send it now but if
you need it, don't mind to ask.

>Mike, K0TER

The only broadcast bulletins I've EVER heard are sent by
W1AW, K1MAN, et al. There is no such thing as a "bulletin ...
like a broadcast" in packet radio.

Sure would be nice if folks would actually READ part 97,
including the specific rulings and clarification from the FCC
before they babble on about this issue.

It was settled long ago by the FCC.

ALLUSA is not illegal.
AGAPE is not illegal.
Selling your car via a bulletin is not illegal.
Talking about the weather is not illegal.
Talking politics is not illegal.

None of the above are "broadcasting."
"Broadcasting" is defined in part 97.
Read it.

From: lebowitz@winternet.com
Message-ID: <4anvqv$k1k@blackice.winternet.com>
Source record: 39931

For several years I used the Case Western version of ka9q to run a gopher server at my old office. It was a nice little program, and I'm now trying to setup a similar server on a small machine for experimental purposes.

I notice that there is a new release of ka9q called TNOS. Unfortunately, it is sufficiently different from the older ka9q that my script files don't work properly.

I have two questions for this group:

1. What are the differences between the various dialects of ka9q? I'd prefer one that runs on 3/4/586 platforms to one compiled for 8086 as is the case with the JNOS I've seen at ftp.ucsd.edu.

2. Does anyone have an autoexec.nos file that will allow me to setup a TNOS box which derives its internet connection thru an ethernet card? I'm not an amateur radio enthusiast, I just want to test the domain name server in TNOS for use in a project. I would use a Crynwr packet driver for my 3C507 NIC that I load before starting up TNOS. I have a registered IP address for this machine, its gateway, and have info on other name servers and time servers on the local network.

Rob

: know your opinion about it, particulary on the following points :

: -Is it a true G3RUH on the 9600 bds port ?

No. When I switched to the KPC9612 from a true G3RUH I did notice that
some of the weaker stations could no longer be received. This was
confirmed by others in our area that made the switch. It works
well with our 9600 bps node which is a true G3RUH. You might
be asking why we switched. The price is reasonable, we replace
two TNC's (9600 & 1200) with one, both ports share the same
mailbox, the user firmware is a grade above the
the others, the schematics are readable, and the documentation
is good. We are using the other G3RUH TNC's for nodes. If any
new person wants a 9600 bps TNC, I recommend the KPC 9612 over the
others. We use them with the TEKK data radio's.

On 14 Dec 1995 01:49:19 GMT Robert Lebowitz (lebowitz@winternet.com) wrote in rec.radio.amateur.digital.misc:

: 1. What are the differences between the various dialects of ka9q? I'd
: prefer one that runs on 3/4/586 platforms to one compiled for 8086 as is
: the case with the JNOS I've seen at ftp.ucsd.edu.

I've recently been experimenting with JNOS and MFNOS (MFNOS is a version based on JNOS that is becoming popular in New England, I don't know if it is widely distributed outside this area) as replacements for the 1991-vintage GRINOS I had been using for several years. Operationally they all seem similar, just different features. MFNOS is becoming popular here especially because it supports nntp news reading and posting, which is replacing list-mailing of public bulletins. It can be compiled for 386+, but this doesn't to provide any major advantages that I can see.

Most of the problems I experienced in going from one NOS to another are little niggling things, various options to commands that don't work anymore or that have changed syntax. My general approach is to try to note all the error messages that appear on the screen during startup and delete or change commands in the autoexec.nos that cause problems. I haven't figured a way to route these messages to a file, which makes it annoying, I either have to copy them by hand or, what I usually do, run through the startup several times, and work backwards through the autoexec, changing the last things that caused messages to appear on my screen each time until I get a clean startup.

Now, there is one thing that has changed in recent versions of JNOS and MFNOS that can throw you off. (I don't know about TNOS, I haven't used it yet). This is that all ax25 and tcp control settings must be located before the attach statements. I don't know why, I presume it has something to do with efficient operation. I have read some strong expressions of displeasure with this.

: 2. Does anyone have an autoexec.nos file that will allow me to setup a
: TNOS box which derives its internet connection thru an ethernet card?
: I'm not an amateur radio enthusiast, I just want to test the domain name

: for my 3C507 NIC that I load before starting up TNOS. I have a
: registered IP address for this machine, its gateway, and have info on
: other name servers and time servers on the local network.

I usually run NOS with an ethernet connection to my local network, as well as a 2 meter radio port. I use packet drivers, and they work well. I also use NCSA telnet with MS-DOS, so I have my autoexec.bat

load the packet driver. At various points I have used NOS with WD-, NE, and 3C-type ethernet adapters and the Clarkson (now Crywnr) drivers, and all have worked OK. I have used NOS a lot for debugging network connections and software, I generally trust it to work and there are a lot of diagnostic tools built in, all sorts of possibilities to trace and look at status.

One thing that doesn't seem to have caught up with all the NOS versions floating around is the documentation. I recommend highly Wade's NOSIntro book. One of its major strong points is the listing of many options for NOS commands. Many of them don't apply to all NOS versions, but it is a lot easier to test and eliminate commands that don't work than to imagine commands you have never heard of before. Some of the older documents are very helpful. Ackerman, AG9V wrote a "Getting Started with TCP/IP on Packet Radio" text in 1992, which I think I got on the net as INTRONOS.TXT. The NOS_1229.DOC file in the the GRINOS 911229 release is also very good.

Much of the documentation for for JNOS and MFNOS is in the form of chronological lists (some oldest first, some latest first!) of changes from a base version. Everything is there, but it isn't easy to use as a reference. JNOS comes with a file CMDSHLPn.ZIP, (the current n is 5), which contains a lot of small files documenting all the JNOS commands. It is meant to be used with an on-line help system; I haven't used it that way, but I unpacked all the files and made hard copy of all of them, sorted in alphabetical order. The result is a half-inch thick manual that I keep in a loose-leaf binder near the terminal. Although I am using MFNOS it diverged recently enough from JNOS that these pages seem generally applicable.

I'll send you a copy of my current autoexec.nos for MFNOS by e-mail.

I have a 9612 running now at 9600 and it is great. I am using the
Kenwood 733 for UHF and Kenwood 251 for VHF. I installed the K-NET chip
from Kantronics to make it a T-NET type node. It is set up on our
network here in Oklahoma City as a UHF backbone to VHF TEX-NET site.
Another ham 3 miles from me runs 2 9612 as I do with VHF outlets to
145.01 and 145.07. I very much recommend one and the best price is at
Oklahoma Comm Center 1-800-7OK-HAMS They also ship for FREE.
Hope this answered your questions. Buy the way, I tryed Icom radios and
found them to be a FLOP on 9600..Stick to Kenwood or TEK...73

> I am interested in the KA-Gold software.

I have run a MFJ 1278, Paccom Tiny 2, KPC-2, KPC-3, Baycom, even the old C-64 unit by AEA (so long ago I can't remember it's name - ha). They all did what they were supposed to do, but when I got my KAM I fell in love with it and the search ended.

I have run telephone terminal programs, paket (not bad for terminal mode), this *com and that *pak and every other packet type program I could get my hands on. Some were pretty good, all perfectly useable but when I got KA-Gold I fell in love and the search ended (although I still have to try out a new program when I find one)!

Just one man's opinion (but highly valued by myself!)

There are a great number of Amateur to Internet Gateways
available. There is a resource listing of all assigned
tcpip ampr net gateways listed in a file called 'resource.txt'
on many popular archive sites. Most likely in the nos or tcpip
file area's....

There isn't many in the Caribbean unfortunately, and the list
in QST does show some popular ones that allow open access
for amateur use.

Much of the BBS forwarding goes through worm holes as a result
of the gateways so I'd say if your in a Caribbean your message will
probably have to go either via HF or ping pong around untill
it finds a gateway...

My resource listing shows few if any 24hr gateways.
in that area.

My guess is Internet access is not easy to come by like it is
here in the states.

> Russ KI7FL

Hi Russ!
The Kantronics TNC will work just fine with any run of the mill terminal software (Procomm, QModem, etc.). The exception to the rule is the KAM+ multimode TNC. It will work with simple terminal software,....to a point! You will be able to use the KAM+ in either VHF/UHF Packet OR HF modes,... not both at the same time. In order to be able to perform both operations at the same time (ie monitor the local VHF packet DX Cluster on one port while working RTTY on the HF port), you will need a program that supports Kantronics "HOST" mode protocol. There are a few around (both commercial and shareware), but don't be led into believing that a simple terminal or communications program can be used to operate both modes at the same time.

A group of hams in our area are building the baycom-type modems for packet. We have the current version of the baycom software. I am wondering if there is any alternate software for this modem? An area of particular interest would be some kind of driver that would allow them to run regular packet software (like PaKet6 or the like) with the baycom.

Thanks for your input on this, and I am sure the baycom guys in this area will appreciate it too. (For my part, I am going to go right on running my KAM and KA-Gold!) Merry Christmas all!

Siliconix makes them. Notoriously static sensitive and prone to
oscillating, but otherwise a damn good FET. What are they, like 10 pF
input capacitance, 30-40 Vds, and maybe good for half an amp? Just
guesses. +5V Vgs turns them on. That's why people use them as logic
buffers for relays and things. I think there are specialized chips for
driving them fast.

In article <4afbjb$rah@charlie.comm.net>, lbooth@comm.net says:
>
>Does anyone have any personal experience with the HAL P38? I am interested in your views and uses
>of this equipment.
>
I have one. It works very nicely on Clover, which is definitely my favorite mode, especially for ragchewing. And it has the best RTTY performance of anything else I have ever used (KAM, PK232 etc.) and Amtor is fine but I dont use that mode much. But Pactor....Not so good. I have a serious problem with the system connecting great to another station and then no traffic passing. HAL has finally acknowledged that there is an obsure problem because the Pactor protocol is not sharply defined and each manufactorer does it differently.

I wish I could be more positive, but the problem is so severe on my card that at first I assumed that there was a rig/computer problem. But that is unlikely because it works flawlessly on the other modes. And it interferes greatly with my enjoyment of Pactor.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

5678. Spread-Spectrum questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-16 00:00:00 UTC
From: c-three@telepost.no
Message-ID: <4auqj7$knc@nms.telepost.no>
Source record: 39815

I understand that spread-spectrum techniques will allow the transmission/reception of signals that are basically 'hidden' in the background noise. I wonder how far it actually is possible to go. How high can the so-called 'processing-gain' be? Will it be possible to recover signals that are just under the receiver noise-floor? Some popular discussion of SS are making statements that are not well founded and difficult to believe.

I have also heard that SS radio is more able to penetrate obstacles like concrete walls etc. This was in an article about indoor wireless LANs. If this is a fact, what are the actual reasons for this?

I would very much appreciate any clarifications or references to where these issues are discussed.

Best regards,

Per-Tore

KPC 9612's are not allowed on our Packet Cluster. The ops says even further that if they find out you have one they will cut you off.

They recommend true G3RUH's from Paccomm or MFJ.

5680. G3RUH in PK900?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-16 00:00:00 UTC
From: bsmith@msn.com
Message-ID: <4av0fc$ek@news.internetmci.com>
Source record: 39817

Got one of the MFJ G3RUH modems yesterday sort of on an impulse. Looks pretty easy to interface into my PK900. Anyone done this or otherwise have any info on doing it. My PK900 has a proprietary port (for their 9600 baud modem) and a TAPR 24pin header. Both seem to have the same signals available. Would prefer to hook into the propreitary port.

Thanks and 73
Bob.

The license info for Baycom 1.6 says that any Ham
can give a copy to another Ham for free.
But, it can't be sold by anyone other than the authorized
dealers. In USA, PacComm is one of the (two ?) dealers.
I bought my copy from them, and its very nice.

So, see if someone will give you a copy. Let me know if
you can't find someone.

>popular discussion of SS are making statements that are not well
>founded and difficult to believe.

The signal you are trying to receive (such as a Frequency Hopped one -
FH) would be as strongly above the noise as any spectral line. But it
is hopped in frequency at such a rate that normal receivers will not
process it (squelch won't open, IF won't track).

For Direct Sequence (DS), the required bandwidth is the initial parameter.
If your system requires 100 MHz bandwidth, then it will probably be very
spread out, with spectral lines falling below the noise. Normal bandwidths
of 1 MHz or less will be well above the noise floor. In this case the voice
bandwidth is only about 3 kHz, and it is spread to a much wider bandwidth
to reduce the spectral lines. I guess the best use would be to have several
channels of voice, all input into the SS radio. Hmm, is FDM/SS legal??

>I have also heard that SS radio is more able to penetrate obstacles
>like concrete walls etc. This was in an article about indoor wireless
>LANs. If this is a fact, what are the actual reasons for this?

It was probably refering to multipath. A conventional modulated radio at
very high bandwidth will start to have its pulses arriving at different times
due to propagation. The mixing of course causes errors. The SS radios
are less affected by this. The only reason a radio transmission would go
through concrete better, is if it is higher in frequency than commonly used.
SS radios are usually 2 to 5 GHz, while the older radios were 900 MHz.

>>running it for a while. Kawin is fair for starters, but to get full
>>use from a Kam Kagold is the ONLY way to go....73 Lee N5KXI

Jeff at Interflex has prepareed a document for Win95 Users, too.
Windows 95 handles multitasking very well, especially applications
like PkGOLD and KaGOLD that do serial communications.

Myth/Rumor control: If anyone tries to tell you that Winapps are
better than DOS apps, remind them that it depends on what the
programmer put into the Win app. PkGOLD and KaGOLD do more than
ANY existing Winapp for AEA or Kantronics TNCs.

As for KaGOLD and PkGOLD for Windows, we have a number of users
(government, military, etc.) and hams who want the flexibility of
using either DOS or Windows. This is not possible for a Winapp,
but is clearly easy with PkGOLD and PkGOLD.

No doubt there will be a Windows version in the future, but the
number of features (scrollback, conference, file transfers, remote
commands, callbook CD support...) is unlikely to grow significantly,
if at all. If you want FEATURES, use PkGOLD or KaGOLD. If you want
less features, and a Windows Only program, there are some out there,
we've seen them.

Have fun with your PkGOLD and KaGOLD -- they work perfectly in
Windows 95, Windows 3.xx, and of course, OS/2, and DOS.

73 -- Jeff

> founded and difficult to believe.

Part of the problem is a difference in terminology between narrow-band and wide-band. If I take a band 100 MHz wide and break it up into 1000 narrow bands, then I will measure 'signal-to-noise' for a signal only with respect to the particular 100 Khz channel. If I take the same 100 MHz band and allocate 1000 SS users to it, then I will be measuring each user's signal with respect to the noise on the _whole 100 MHz band_. My 'signal-to-noise' ratio now appears to be 1000 times worse, because I'm measuring it against the noise in a 100 MHz band instead the noise in a 100 KHz band.

The best way to think about spread spectrum is to generalize the notion of what a 'carrier' is. In traditional radio, a 'carrier' is a continuous wave of a single frequency that is modulated with your information signal. In SS radio, the 'carrier' is a much more complex waveform that has a wide bandwidth. But the amazing thing is that with the exception of the parts of the radio that generates the carrier and synchronizes it, the basic blocks of the radio still do the same things and in essentially the same way! The receiver generates the 'same' carrier, which is mixed & downconverted as usual. The wideband modulation gets put back together into a narrow baseband, _and the same process takes narrow-band noise and spreads it out_. Actually any noise uncorrelated with the carrier is spread out, including other information-bearing signals.

> I have also heard that SS radio is more able to penetrate obstacles
> like concrete walls etc. This was in an article about indoor wireless
> LANs. If this is a fact, what are the actual reasons for this?

You may be referring to the fact that SS has 'frequency diversity', and hence fading of any particular frequency won't hurt the signal as much.

Probably your best single book on SS is:

Dixon, Robert C. "Spread Spectrum Systems with Commercial Applications, 3rd Ed". John Wiley & Sons, NY, 1994.

Also:

Kesteloot, A., and Hutchinson, C.L., eds. "The ARRL Spread Spectrum Sourcebook". ARRL, 1991. ($20.00)

Torrieri, D.J. "Principles of Secure Communications Systems, 2nd. Ed.". Artech House, Boston, 1992.

Viterbi, A.J. "CDMA: Principles of Spread Spectrum Communication". Addison Wesley, 1995.

This has no relation to why the KAM won't do 9600 baud. The modem is NOT
proprietary. The KAM uses a 3105 modem chip for the 1200 baud and SCAF filters
for the HF/300 baud.

It is true that the KAM won't do 9600, however. 9600 requires a different
modem altogether, but the KAM handles HDLC in firmware and the processor
doesn't have enough speed to do 9600. It's kinda like trying to run Windows
3.1 on an 8088 machine - just doesn't have the horsepower.

You might look at the KPC-9612 - dual port with 1200 and 9600 baud
simultaneous operation.

From: J_Towle@msn.com
Message-ID: <00001fec+00000e68@msn.com>
Source record: 39842

Stan,

First, your comment that "KaWin is not as full featured as KaGold" is also what our users tell us, and apparently you are aware of this. To say "catching up" is a form of "vaporware" promises. When it catches up, we'll see where KaGOLD is at that time.

Second, regardless of the platform (DOS, Windows, Unix, etc.) a program can only do what it is programmed to do. It seems that some users have said "No DOS program can do what a Windows program can do" (I read that a few months back) but unfortunately, this is not the reality. The fact that a program uses the Windows interface does not automatically endow it with features.

As for KaGOLD, it is "multitasking aware" and as a result, runs fine in Windows 3.xx, 95, OS/2, Windows NT, and DOS, on systems from 8088 to pentium plus. While windows would offer object embedding, dynamic linking, etc., these features are less important to a communications program than they are to applications like word processing or graphics.

Also, Windows 95, Windows NT, and OS/2 run DOS apps even better than Windows 3.1. In some cases, even faster than native DOS.

Regardless of what program a user selects, less featured Winapp, more featured DOS app, it should be clear to everyone that running DOS apps in Windows does work, and work VERY well. In Windows 95, all that is required is to find the EXE file using the explorer, and drag it to the desktop. With a few changes to the program properties (right click on the icon) the program is a mouse click away.

George,

Thanks for the comments about KaGOLD.

As for the updates, they have run from $10, $15, to the most expensive one we had on this last upgrade to version 9, which was $49.95 (1/2 the full price). I would be surprised about the total cost of upgrades exceeing the Kantronics cumulative cost, since I believe Kantronics gets about $30 on each ROM upgrade, and there have been several.

The cost of software development isn't cheap, as you can imagine. If we could get Uncle Sam and the State of California to ease up on the cost of doing business, we could just give away software, hi hi.

Have a Happy Holiday Season !!

Why?

Becuase they say from their 13 years experience that 9612s are not true G3RUH
standards and suffer for it by very bad throughput.

The Bit Error Rate test with the KPC-9612 against G3RUH (which is used in the
Kantronics Data Engine) show this to be incorrect. I'm not sure what figures
"they" are quoting - if any - to support this claim. In the real world
networks using mixtures of KPC-9612, Net/ROM (in whatever tnc), G3RUH or K9NG,
there is NO SIGNIFICANT difference in throughput - assuming the user has
properly adjusted their equipment.

5723. MFJ-1278BT HELP!!! Please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-17 00:00:00 UTC
From: tracker@indirect.com
Message-ID: <tracker.21.00635D24@indirect.com>
Source record: 39860

Okay, I know I'm not going nuts. This is driving me to drink, or worse.

I sold an old 286 computer I used for radio work and moved my MFJ-1278BT to another computer (4DX100). I'm using COM3 for the TNC, and I have my I/O card configured for IRQ9 and an address of 03E8. I'm using Procomm+ 2.11 for Windows until I can get WINPACK installed. I was using Procomm+ for DOS before on COM2.

When I power on the TNC Procomm indicates an on-line status and the "modem" lights CON, DCD and CTS lights are on, but I can not acquire the TNC like before. I have similar problems with other communication packages, some for packet.

Any ideas?

Mark Saunders, KJ7BS

Source record: 39861

GK>> back. The problem is that every time that I go to SSB, with the PK
GK>connected,

GK>> I get garbled audio. I have to unplug it to get the thing to work properly
GK>> Anyone have any ideas on correcting the problem.

Kenwood has a mod for this. The audio output of the TNC is too high and
overloads the microphone amplifier circuit. What you do it fix it is
add a 10 db attenuator to the PKD line on the IF unit (X48-3080-XX).

Change chip resistor R258 from 2.2K to 1K (RK73FB2A102J)
Change chip resistor R260 from 220 to 330 ohms (RK73FB2A331J)

They also suggest that the TNC and radio have separate power supplies.

When adjusting for proper ALC with an AFSK RTTY terminal or Packet TNC
therminal you should adjust VR-18 on the IF unit for a reading similar
to the one shown in the accompanying diagram..

```
S----|----|----|----|----|----|----|----|
1 3 5 7 9 20 40 60db
@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@
0 1.0 2.5 5.0 10.0 15.0 W
PWR | | | | | |
-------------------------------------
------------- ALC ---------
SWR +++++++++#############################
db 1 -20 ^1.5 2 3 20
|
Don't make initial ALC adjustments for Packet, etc.
over this level. Adjust higher only if you can do
this without distortion.
```

I hope you understand the diagram. I'm not the greatest artist.. I
never did put the mod in my rig. I just turned VR-18 down. That seemed
to help if I have the processor off, but have to unplug the TNC with the
processor on. I'm just going to put a switch in the TNC line.

Hi ...

I run one on my HP-100LX using either Procomm or MSYS. By using MSYS
I have a full blown BBS (K-Node, Net-Node, TCP/IP, etc.) which can interface
with the real BBS at home. As a user I normally use MTERM which is a little
terminal that come with MSYS.

Works great.

I would suggest checking the FRACK, DWAIT and the various other timing
values and see if you have those set far from the factory values. A hard
reset that restores those values would be in order. Did you try checking the
PTT out of the TNC with an ohm meter? Is it keying? I think it supports the
key down tone test that you could set up. I believe that is documented in
the manual. See if it keys when you do that test.

> I might find such software?

I used to have a PC/FlexNet driver written by Tom, HB9JNX, on my HD, but
since PC/FlexNet version recently changed , I still haven't got the update
and the old driver doesn't work anymore.

This driver uses a mere Sound Blaster within the PC/FlexNet system (486
needed, according to the DOC file :-)).
That's all I can say, I have no ftp site, sorry.

What about trying TFPCX 2.10 ? This driver can be easily interfaced to the most famous programs (FBB, TPK, TOP, SP, GP 1.61, etc...). You should give it a try, it's worth it :-)) If you need a simplier version, use TFX.

Unfortunately, I can't tell you where you could ftp the drivers, but I'm sure you'll find out (if you don't, send me an email, I'll use my UUE :-)).

Can anyone tell me the percentage of charging current that I can apply to a group of sub c cells to keep them fully charged? The 15 hour charge requires 130 ma for 15 hours. Is it 10 ma, 20 ma. I can't seem to find the info. Would appreciate info. Thanks.

>They recommend true G3RUH's from Paccomm or MFJ.

Why would that be?

We have a whole slew of 9612s and a whole slew of MFJs.
We have had a great deal of trouble with the MFJs.
The 9612s work fine. Plug 'em in, they run.
We just recently replaced some MFJs with 9612s at one
site, just to avoid the continuing problems with the MFJs.

Much cleaner eye patterns with the 9612 demod, whether the
transmitter uses MFJ or 9612 ...

However, we have many links which use the MFJs and have never
shown any problems. These have been short haul links with very
solid signals. 9612s have worked better on our longer / marginal
links ... probably because of the cleaner demod.

Do you have some adverse experience with the 9612s you can share?
Or is it just a matter of brand name bigotry involved?

... Hank

Hello Richard and all others

There is a program that can help you, it is called multi.
With the program you will be able to make many differents groups e.g the local radio club.

I use the program here on our FBB, and have made some groups, one of my groups is a list of all users, then it is easy to send mail to all users.

Send me a mail, and I will send you a copy.

Hi all,
UltraPak version 4.0 is available from:

ftp.demon.co.uk /pub/ham
ftp.tapr.org /tapr/software_lib/terminal

Filename is upak40.zip. You also need upak401.zip, which is an updated
executable and README file to cure a bug with the compressed download
routine. This is at the sites mentioned above also, but is in the
/pub/ham/general directory at the demon site.
73, Tim.

>Any ideas?

Go into Control Panel in Windows, and go to Ports Setup. Set the new IRQ, and
the address. If your UART chip in com 3 is 8250, set the baud to 9600. If its
16550, set it to 19200.

If this doesnt work, you probably have an IRQ hardware conflict, try useing
IRQ 5 for com 3...it should work fine. :)

Happy holidays.

>>>I'm not sure what figures "they" are quoting - if any - to support this claim.

They say it's just their experience. While not an expert there are many factors that can alter what you see in a lab - equipment, terrain, interferance etc all combine to make every situatin different.

The guys on my cluster are just giving their opinion based on what they have tried - for users to get up the fastest. They were just more stringent about no 9612's. They just couln't get them to work like the others given the same paramters (radio, power, antenna, etc).

I frankly was surprised myself at that too. While Kantronics (except for data engine series) is missing expandability (no tapr header or proprietary slots (except 2400 for the KAM)) and they use their own proprietary systems - they usually make up for it with superior operation (they more or less have to).

Hello Russ...

I have a KAM-Plus, KPC3 and a 9612 and they run fine with a standard
modem terminal program. The "host" mode software will make your life
easier but is not needed.

I have KAM's HostMaster for Mac, KaWins for the PC and run both
MacAPRS and PC Aprs with out a problem.

Hope this helps

Hi gang,
Anybody outhere has ever heared, or has hands on experience
with the IBM PC-compatible software called L2PCX,
which is an AX25-driver 9600bit/s FSK (G3RUH) and only needs
3 (three) IC's for the modem part ?
The software originates from OE5DXL and was originally developped
for the ATARI ST series computers, which used a similar hardware setup.
Thanks for your time.

Hank

I suggest you use compressed message upload/download for this. Does
your BBS support FBB style compressed messaging??.
Compressed messaging is much more "friendly" that straight ln,rn etc
etc.

I don't think that there is a simple answer to this one otherwise....

Cheers..Peter..

One thing that you might try with the P38 is to set the CS Delay to
a value of at least 40. I have two of the PCI4000ms and I was having nothing
but problems with links going into ERROR state. After I made the change to
the CS delay the recovery time for for link errors is very fast.

Hope this helps.

5756. FBBIOS problems...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-18 00:00:00 UTC
From: SKORIC@uns.ns.ac.YU
Message-ID: <951219001235.2017@uns.ns.ac.yu>
Source record: 39886

Hello all!

I keep trying to link two FBB machines via the telephone modems. Actual
configuration is as follows:

1st system: PC286 + FBB5.15 + TNC (VHF) + 2400 non-MNP modem (internal)
2nd system: PC XT + FBB5.14a + TNC (HF) + 2400 MNP modem (internal)

On the radio side, both systems work ok, depending on propagation etc.
But, a telephone link in between is not ok. Symptoms are as follows:

1st system (supposed be the one that only answers to the phone calls
from the other side): in a very rare situations a connection to
this system results in nice link i.e. its modem says:
CONNECT 2400 REL/5 ; but in most cases it says only CONNECT 2400
and a lot of garbage is on the screen... and it's not the worst
thing, because after the closing the link (hang-up, ATH, from the
other side) it is no more possible to establish the new call with
this system. The line is always BUSY because its modem did NOT
go on-hook (off-line). Although there's no problem on the radio
side, a reset of the BBS must be done in order to try calling again.
And, in a case of forward-call from the other side, after the
connection nothing happens. From the console, the outgoing calls
have been done and, if CONNECT 2400 REL/5, everything is ok.
Init string: ATZS0=5

2nd system (supposed be the one that initialize either manual call from
the console or for forward): in a nice situation, his modem says:
CONNECT 2400 MNP5; but (!) only if it is manual call from the
other software (Comit etc.) you are connected as regular user to
the 1st system. Everything goes fine untill the phone link is
broken due to external reasons, I don't care about. But, after the
repeated call I usualy get BUSY from the 1st machine (as above).
In the case of the forward action, if successful link, after the
CONNECT 2400 MNP5, the 1st systems doesn't ask for call and
password and nothing happens, the line stays opened so long till
manualy hang-up. From the console, outgoing calls have been done
and, if CONNECT 2400 MNP5, everything is ok. The worst thing:
after the 2-3 remote phone line rings (ATS0=5 because the 1st is in
the office), the 2nd modem starts sending its carrier BEFORE getting
the carier from the called station and then the result is bad link
and disconnection etc.. Init string at 2nd: ATZS0=0

...more details: on the 1st system (FBB5.15) I tried several versions of
FBBIOS.COM (1.30 1.34 1.44) and all of them seem to behave the same way.
On the 2nd system (FBB5.14a) I've tried all of them instead of the 1.21

("original" version from the package) and it seemed the 1.21 behaves a little bit reliable than the others.

FBB's manual says "a protocol correction like MNP must be used" so, I suppose the both sides should (must?) have some kind of error-free. Next, I tried to change the speeds in PORT.SYS (from 300 to 2400) with no success. I carefuly checked IRQ's (on the both sides TNC's are on COM1 IRQ4, modems are configured as COM4 IRQ3). I recognized a BUG in APPEL.BAT because if you describe a string: FBBIOS <port> A <- (A) auto baud detect there is much more garbage on the screen than without 'A'.

My question are:

1. What the "REL/5" stands for? Is it a kind of error-free connection?
2. What are your experience with different FBBIOS.COM versions?
3. What do you advise me to try next?

Pse, don't tell me to buy better equipment. I'd already run Pentiums if I could afford that!

Hello Damien

I have a KAM-9612 connected to a Yaesu 2500m with the factory 9600 mods.
It works well and I have not had a problem with it.

I drive it with KaWins on the PC and MacAprs on the Mac.
(I work with both Macs & PC)

Hope this helps

> telephone modems and auto-detect and adjust to incoming signals.

Nope. The auto-speed selection is an advanced function of phone modems, and that hasn't made its way into packet modems. Yet.

Matter of fact, your 9k6 station won't even be able to hear the 1k2 signals, and mixing speeds on a radio channel results in huge problems, as the 9k6 transmitters are constantly transmitting simultaneously with the 1k2 transmitters, and vice versa - a bad case of hidden transmitter syndrome, and no data flows.

Even worse, your 9k6 modem cannot be made to ever decode 'normal' 1k2 signals. You'd have to switch back to your old modem.

But, once you find another channel to put the 9k6 access, believe me it is very much worth the effort. However, before you buy ANYTHING, do some research to learn exactly what will and will not work, so you don't waste your money on a really nice radio, that just can't be used for 9k6.

From: elmartin@pita.nms.unt.edu
Message-ID: <4b5fjs$319@hermes.acs.unt.edu>
Source record: 39752

Hello All,
I have been looking at trying to establish a high speed link between two cities that are aproximately 100 miles apart. I would like to run tcpip across the link. First, I am trying to figure out how I can manage the tcpip packets across multiple ports. I know that jnos40 can be installed in the firmware of a data engine for two ports. However, I am looking at running at least three ports at various baud rates. Can multiple tncs be stacked together like in a netrom node stack with using firmware that can handle tcpip? If not, are there any other options that can help me with this situation? My second question is how high of a baud rate can be used over a fairly long haul? I am looking at hopefully putting up the nodes on two commercial tv towers that are approximately 90 miles apart by air. I believe that 56k (or is it 57.6k?) can be ran over 220 or 440 MHz. I would think that given the sites mentioned above, a direct link might be accomplished with directional antennas. Can anyone out there with experience or knowledge about 56k tell me if that is realistic or not? Also, does anyone know if higher baud rates than 56k can be achieved without having very short hops. I am primarily curious about spread spectrum links. I have heard of these types of links, and I believe you can achieve 2 megabytes per second at least over them. However, I believe they can not handle paths over several miles. Can anyone tell me how long of a path can be achieved ideally for these speeds? I would appreciate it if you could reply via email because I believe that my news feed misses some of the articles some times. TNX & 73

If you are looking for higher data rates then you will need to sit tight and wait for the new PCS rollouts and you will see some 2 Ghz + spread spectrum equipment that will handle the higher data rates. Microwave is currently very expensive for the necessary radios. Even at 900 Mhz you are talking about some very expensive equipment!

> 3 (three) IC's for the modem part ?

Hello there...
I am not using the L2PCX driver with this very simple 3-IC-modem regulary, but have used it already for some time. Well... this are my experiences with it:
- It really does work! Quite amazing what you Chris OE5DXL did there, with a good piece of software, and just a 3-IC-modem (two simple TTL-IC, and one Op-Amp).
- On some computers it can be tricky to get running. One problem are some incompatibilities at the seriell interface. It operates at 38400 bauds (1 start, 1 stop, 6 data), with two AX25 bits/transfered byte, making 9600 bits/second. Some seriell controller chips have some internal delays at this rate, resulting in a lower speed (abt 9500 baud) and thus it will hardly work on a 9600 baud node.
- Resulting from above 38400 bauds on RS232, it needs 4800 Interrupts per second, which is quite much (The TFPCX driver for the 1200 baud Baycom Modem needs 3600 for RX and 1200 for TX.) Of course you can't use it with M$ Windows, or OS/2, or similar multitasking operating systems. But still under DOS there can be some problems. On some BIOSes, the Interrupts are locked during accesses to the Hard disk, so in this case you can't RX or TX while during this time (BAD!). Some EMM-drivers can lock interrupts, etc. Best thing is to take everything what you can do without out of your CONFIG.SYS and AUTOEXEC.BAT. And use the oldest DOS-Version you can get, the older ones don't lock interrupts as much as the newer ones.
- It does consume quite some computational time, especially if you use it with G3RUH-scrambling (you can do without on a point2point link, especially if you have good DC-modulated transmitters, but of course you need it accessing a node operating with a G3RUH-compatible modem...)
It consumes about 8MHz Landmark speed, so it WILL NOT run an old 8088-XT, and it will make a 286-AT considerably slower. No problems of course on >= 386.
- In comparison with an 9600baud-TNC, it will TX nearly equally. If the RX signal strenght is good, the decoding performance will also be almost the same. If the signal gets such low, that the TNC gets some problems in decoding frames (maybe less then one out of two...), the TFPCX will hardly decode one any more, I think because of a problem with syncronisation to the RX clock. That's not what a good 9k6 connection should be like, but if you have to fight against week or QRM'd signales, you better use a TNC.

Ok. Thats all what I can think of in the moment, concerning the L2PCX driver. Concluding I should say that is quite useable, performing just slightly worse than a real TNC, at least on most computers...

The general rule is that you can safely apply 1% of the rated capacity
continuously as a maintenance charge. Your cells appear to be either 1250
or 1300 mah, so apply 13 to 15 ma and you'll be OK.

With a 1270 (no suffix), you will need to upgrade from 16K to 32K of RAM to use any of the recent (last 7 years!) firmware. The latest free firmware available is 1.1.8a and is available from ftp.tapr.org (The MFJ 1270 is a clone of the TAPR TNC-2).

5782. Ax25 Utilities under Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-19 00:00:00 UTC
From: lambert@pluto.cs.kuleuven.ac.be
Message-ID: <4b62ji$2j8@idefix.CS.kuleuven.ac.be>
Source record: 39769

We have serious trouble using the AX25 utilities. (version 1.3.46 together
with linux kernel 1.3.47)
We have a TNC in KISS mode attached to COM2: and we try to initialize it
as follows : axattach /dev/cua1 ON1KUL-14
Then, when I run the program axl, it says that the connection is not in use.
Also the program axparms always gives a segmentation fault.
Could you please help us ?

The goal of our ptoject is to set up a TCP/IP connection between our PC
and a computer on the Internet, OVER ax25, using the gateway
@hamgate.kulnet.kuleuven.ac.be

We have been searching on this for several hours, but there seems to be a
fundamental problem. What is wrong ?

Thanks a lot for your reply. ANY messages concerning this are VERY welcome.
Bye.
Emmanuel Lambert

RC modelers also use a ton of Nicads. One suggestion I have adopted from
there has worked very well for me.

Use the standard 10% charge rate but put it on a timer. Charge for 1-2
hours every 24 hour period.

This allows you to use the common chargers that come with the equipment
and appears compatible with long life. Just buy a $6 timer at Walmart.

In some cases, this also seems to help cells with higher self discharge
rates than nominal (it's called getting old).

From: cdlevin@hyper.shadow.net
Message-ID: <4b61an$1jd@bud.shadow.net>
Source record: 39775

Best Nos yet for Linux. Tnos 2.02 is available for gateway, conv
and everything else. Get tnos-2.02.tgz, unzip it to /tnos,
edit the autoexec.nos, then make sure your modem is on com1 or
com2, dial in with minicom, and establish connection, then quit
minicom, fire up Tnos and you're there.

Editing the autoexec.nos can be a pain, so don't be afraid to
post questions her relating to it, if you have problems. OK,
ttyl.

: > connections at 1200bps? That is, do high speed TNCs behave like
: > telephone modems and auto-detect and adjust to incoming signals.

: Nope. The auto-speed selection is an advanced function of phone modems, and
: that hasn't made its way into packet modems. Yet.

: Matter of fact, your 9k6 station won't even be able to hear the 1k2 signals,
: and mixing speeds on a radio channel results in huge problems, as the 9k6
: transmitters are constantly transmitting simultaneously with the 1k2
: transmitters, and vice versa - a bad case of hidden transmitter syndrome, and
: no data flows.

: Even worse, your 9k6 modem cannot be made to ever decode 'normal' 1k2 signals.
: You'd have to switch back to your old modem.

: But, once you find another channel to put the 9k6 access, believe me it
: is very much worth the effort. However, before you buy ANYTHING, do some
: research to learn exactly what will and will not work, so you don't waste your
: money on a really nice radio, that just can't be used for 9k6.

don't quote me on this (hi), but i think you can set up the kpc-9612 so that
it can detect which type of signal it is reciving. But you can only use one
radio (you connect it to both ports).

Source record: 39697

I'm thinking of building a transmitter strip for 222 MHz FM to use
along with my scanner as the receiver, just to check out the local
repeater action on FM.
Wondering if anyone has some simple designs for such.
My present approach is to use a PLL/VCO synth into a couple of MMICs
that drive a 2N5179 into an MRF227 for a couple of watts out.
The latter RF stages borrowed from "The Elevator" 222 MHz transverter
(Jan. 90 QST).
Any comments/suggestions welcome !

Thanks..Hugh Duff VA3TO

You may be able to make a serial-to-parallel converter. But, I guess you
might have good solution after you go through your printer manual. It
probably has a serial interface option or already have one.

5799. Help! on conecting dx-cluster to anothers clusters!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-20 00:00:00 UTC
From: yv5dta@igc.net
Message-ID: <4b7joh$agt@IRIS.igc.net>
Source record: 39780

Hi
I am doing some research on how to connect our local dx cluster to other clusters. The nears dx-cluster to us in Jacsonville, FL(our Cluster is in Ft. Lauderdale, FL). My firts intention was connecting us via the Internet, but that has a very slim chances!
Now, does anybody else has any experience connecting clusters using net-rom?
has anyone out there had done something similar?
please e-mail me with your comments

Thanks
Steve W4/YV5DTA

Hi,

I'm trying to get my JNOS configuration to initiate a PPP connection
with my local ISP. How do I do this?

I've attached the modem port and can get the modem to dial out using
the comm command. Can I specify a script file to automatically login?

The purpose is obviously, to send mail via my NOS box to the internet.

Any ideas appreciated.

>
>andy, g7ueh

Well your both right...'single' modem TNCs can only 'hear' one speed, but
the 9612 has 2 modems, hence, can be set up for both speeds at the same
time. I further think it will work on one radio, if that radio has both
data sources (ie; 1200 bps pin out, and 9600 bps pin out), however, the
signals cant be 'shared', except to allow the 'gate' feature in the 9612.

Happy holidays. :)

I agree with the new PCS, but I thought (FCC rules and regs) part 15
made some restrictions on operating range??? 60 miles???

Aren't we talking two very tall towers??? to achieve line of sight?

I don't think he wants to put up a ship in the middle for a
repeater:-)

Might want to look and see if Ma Bell or anybody else is jumping that
span with a terrestial microwave that you can either hop a ride on
(for a fee of course) or borrow some tower space (probably also for a
fee) and bounce from your office to the tower then to the tower on the
opposite beach and on to your other office.

BTW if you are trying to connect two networks? go for more bandwidth,
you'll need it almost as soon as you get the two nodes connected
(voice of experience:-)

This is a common problem that does not seem to affect everyone. It
was discussed about 2 years ago at lenght and we did come up with some
solutions. Why it affects some and not others - I do not know but I
do know we camme up with some solutions. The easiest is below.
Additional info - give me a shout.

>>
>
>If you use FSK then there is no problem because there is no audio connection made to ACC2
>--

Another solution. I have in my setup both AFSK and FSk hooked up
since I use pactor and it is possible to be free of SSB distortion.

>---
>| gerry EMail gerry@g4mya.demon.co.uk |
>---
>
>

There are floating ground problems with the 50s series of TS
transceivers and more often than not it is a problem even when usingg
FSK. One solution - Which worked for me until I changed from the
Kenwood desk mike to the Heil headset is as follows:

Add an extra ground wire from the PK232 to the rig by:

The right rear leg pad of the 232 (looking from the front and the TNC
is right side up) is screwed into the base of the TNC. This screw is
grounded. Add a wire there by unscrewing the leg a bit, and then route
the wire to the ground lug at the back of the rig. This often works
(if you are using the proper grounds in the ACC plug at the back of
the rig). Note - that in my case (TS690s) and others (850s) it worked
and with others it did not. When I changed to the Heil mike/headset I
went back to having distorted SSB.

The same setup worked with the 2232, until the Heil set, so since I now use the 2232 for satellite and HF work, I eventually solved the problem by putting a switch box on PORT 1 so I could switch between rigs. Thus when I work HF on SSB I just switch to the V or U HF rig and take the 690s offline,

If you want additional details as to connections (some grounds in the acc port are direct grounds and others have a capacitor inline) let me know.

Regards,

Davdi Seeler, VY2DCS

5818. What's good software for PK-232 on IBM compatible?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-21 00:00:00 UTC
From: dls@genrad.com
Message-ID: <4bbklilNN9ua@sweetpea.genrad.com>
Source record: 39705

I've just recently got my packet radio station working again after over
3 years of non-use. However, I'm using a different computer (IBM
compatible rather than the previous Macintosh), so I don't know much about
what is good software for an IBM compatible. I've tried a couple (with
not very good success), and am currently using just a terminal emulator
package (ProComm). I've heard of a couple good ones, like PK Gold....but
they seem to have a limitation that I cannot tolerate: They only allow
ONE callsign! Since I have two callsigns, this is unacceptable.

Can someone recommend some good software to run with my setup? I've been
watching this newsgroup for about a month, but haven't seen anything on
this subject, so I decided to ask myself. I have a PK-232 TNC with an
IBM compatible laptop running MS-DOS 6.2. I prefer a DOS program...my
laptop can run Windows 3.11...slowly.....a 386 works best with DOS I guess.
I'm interested in freeware and shareware WITH GOOD DOCUMENTATION, or
commercial software which does not have severe limitations like the
PK Gold software mentioned above.

Thanks much for your interest.

Does anyone know where I can find some packet software for an Amiga computer?

5821. Setting deviation for packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-21 00:00:00 UTC
From: jms@col.hp.com
Message-ID: <4bbtvv$s6s@nonews.col.hp.com>
Source record: 39708

One thing has not been clear to me concerning setting the deviation on a radio for packet operation (actually, adjusting the levels from the TNC). I've read that around 3 KHz is optimum, but is that 3 KHz on the low tone or the high tone? On most radios I've worked with, the pre-emphasis circuitry will cause the high tone to be about 1 KHz higher in deviation than the low tone. So a radio set for 3 KHz on the low would be 4 KHz on the high. I've always compromised and centered the deviation around 3 KHz, with the low tone being lower and the high tone higher than 3 KHz.

What are your thoughts on this?

Mike Stansberry, K0TER

5822. Pk/Ka-Gold Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-21 00:00:00 UTC
From: Mark Oppenheim <Mark@Tetherless.com>
Message-ID: <4bcisd$9up@gorgor.pa.tetherless.com>
Source record: 39709

For all you Interflex users out there-

I know that Jeff and Lynn has implemented "Zmodem-like" re-startable
BINARY file transfers in Packet mode, but what about PACTOR and GTOR?

1) Are binary file transfers even possible with these modes, using this
software?

2) Can a BINARY file transfer be re-started - or remotely requested using
non-packet modes?

Thanks!

Mark

5823. configuring JNOS to access a KTU

>power, antenna, etc).

Aside from that, I need to ask a question. If they "cut you off",
which is, in other words, interfering with your transmission, aren't
they violating FCC regulations in doing so? Let's move the analogy to
voice. Let's say that everyone that *I* talk to that used an HTX-202
had what I considered excess noise on their signal, and I refused to
talk to them, and if I heard someone on that I knew used an HTX-202
and I keyed over their signal, or cut them off at the autopatch,
someone would be sic'ing the FCC on me. If I tried to tell someone
that they could only use certain brands of radios to talk, I think the
ACLU would be volunteering to take my case. How can they get away
with this kind of behavior?

Any enlightenment on the issue would be appreciated.

Mike....the usual formular for charging NiCds is to take the amphour rating of the cell expressed in milliamp hours and divide by ten. That is how you got the fifteen hour charge rate of 130 ma. To obtain the trickle charge rate, divide by ten once again. That result is a trickle charge of 13 ma. 73 Cliff Buttschardt W6HDO

5829. HELP! PLIP and JNOS - Any successes

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-21 00:00:00 UTC
From: betts@ee.ualberta.ca
Message-ID: <betts.15.000C8E13@ee.ualberta.ca>
Source record: 39716

I'm trying to set up a plip link between my jnos box
and windows winsock. I've loaded the plip driver
on the jnos side and "attached" it and on the windows
side have loaded plip and winpkt as well as the relevant
winsock setup stuff. I haven't been able to get the two
to communicate with each other...

If anyone has had any successes with this type of
setup I would like to here about it.

Thanks

Well actually I have found out where to buy Cellular Phone Programmers
that program many phones in under 10 seconds, and it's in service for free,
the handheld device weighs about 10 oz. and it is kind of pricey but then
again if your gonna make alot of calls it's worth it, they cost $3000.00
plus S&H I think the sales tax is already added on but I'm not positive on
that, So I could possibly make a deal with you on that because I sell them
for the company now, well if your more intersted please write back. Thanks
alot. Bye

My club had one donated to it last year, ...

The antenna is a NITEMARE to setup!! They recomend at least an antenna
analyser to tune it, because of all of the interaction between band elements.
And be prepared to spend at least a couple of days tuning the darn thing!.

In my opinion you would be better off setting up a multi band wire dipole.

A LOT less hassle.

Just my 2 cents worth

> Also the program axparms always gives a segmentation fault.
> Could you please help us ?

Instead of trying to use /dev/cua1 try attaching to /dev/ttyS1 instead.
cua1 is a modem callout device ttyS1 is a terminal device, and seems
to work better here on my system (1.3.45)
The only time I use /dev/cua* is with packages like dip, etc. that require
that device type.

Hope this helps some.

5837. Hams with Mac DataBase

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-22 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-2212950537490001@wd1v.mv.com>
Source record: 39724

"Macnet Roster" (ver. 725) has just been updated and is now a stand-alone application! The version number = the number of hams using Macs.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Or connect to my home page via the WWW

http://www.mv.com/ipusers/wd1v

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

73,

FYI: The latest version of Digital Scope.FAQ <304> is on my WWW Home Page.
(All opinions are my own, including Digital Storage Scope.FAQ)

Best Holiday Wishes!

>What are your thoughts on this?

It is what many refer to as "twist." But you are doing it incorrectly. You want the deviation slightly below 3 kHz on the high tone (2.2 kHz) and the low tone (1.2 kHz) will be fine. By going much beyond 3 kHz you will start clipping and distorting the signal. Low deviation is better than distorted audio. 3 kHz is already at the edge of stock radio bandwidth, and going beyond that leads to poor operational links.

>
>Any enlightenment on the issue would be appreciated.

Well in packet, the term "cut you off" doesnt mean "interfering". Your
node, mailbox, BBS, station, ect. can be set not to accept certain callsigns.
You store the 'list' of calls either in the operating firmware of the TNC, or
the controlling software. This doesnt stop and/or interfere with that station,
just doesnt let that person from useing your equipment.

The only call I keep in my list is "NOCALL". This is the default 'callsign'
of a TNC when its powered up, and the user doesnt put his call in.

Other than purposful and malicious illegal transmissions, I would try to
work the problem out with the station, rather than 'lock' them out.

Happy holidays :)

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

NET/Mac v2.3.56 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Fixes for AddResMenu() bug in System 7.5.3
- Implement 'whenquiet <command>' command
- Implemented some temporary mods to keep track of sleeping sessions
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one FORMATTED disk and a *self addressed and *STAMPED disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

73,

FYI: The latest version of Digital Scope.FAQ <304> is on my WWW Home Page.
(All opinions are my own, including Digital Storage Scope.FAQ)

Change out the electrolytic caps in the voltage doubler section of the DC to DC converter on the display circuit board. Also while your are at it stab the - 5 volt supply with a scope probe to see if the -5 volts is noise free, if not also change out those caps. All should then be fine again.

>Season greetings to all

Well I just open a recieve file (say...CONFIG.TNC), then do a DISPLAY. All your settings are saved in that file. Say you go run APRS, and want to change back to your original settings, just simply send that file (CONFIG.TNC) back to your TNC at the command prompt, and it sets everything back the way it was. Works on all the TNCs Im familer with...MFJ, KPC-2 and 3, 9612, KAMS, and AEAs. :)

Happy holidays, & 73.

ATTACHED FILE <35k TEXT File>......
send me (john@wd1v.mv.com).........
an EMAIL where the subject contains
the text "subscribe scope.faq".....

or go to the WWW page listed at the
end of this file...................

KEY ISSUES REVIEWED IN THE FAQ (in order of appearance)

* DSO INDUSTRY TRENDS (Whats happening in DSO technology this year?)
* DSO FORM FACTORS (What types of DSOs are there?)
* PRIMARY DSO FUNCTIONS (What can DSOs actually do?)
* COMPARISONS (How can I best compare various models)
* APPLICATIONS (What are the most common DSO applications?)
* ADCs (What speed do I really need on each channel?)
* BANDWIDTH & TRIGGER (What numbers and functions are right?)
* ARCHIVAL & MEMORY (How fast, how deep, and can I get more?)
* DISPLAYS (What am I really looking at?)
* MEASUREMENTS (How much is my signal changing over time?)
* DIGITAL SIGNAL PROCESSING (How can I obtain more useful information?)
* DEMOS & PURCHASING (How can I see and get the DSO I really need?)

I called AEA on 12/20/95 and was told that MacRatt 3.0 will be shipping in January. If you accidently bought V2.6 (as I did) during the last 60 days, AEA will send you the upgrade to V3.0 (when it is available) for $US5.50 (their shipping and handling costs). You can FAX them at (206) 775-2340. I tried their CompuServe email address and have not heard back... I am just an AEA customer, no other connection...

Well ..... maybe the fellow who wrote the new MacRATT version 3 will show up here and make his own comments. From what little I know ... he is not the same fellow who wrote the previous versions ... in fact he has written at least two other amateur radio - related software applications (both of which, I use). And .... I am very pleased with these other applications. I don't care for the A.E.A. machines myself, but am almost considering one now because I know about the quality of this fellow's work.

BTW, he lurks around these Usenet newsgroups and may make himself known. As I recall, he was at Dayton this past year in the AEA booth to demo the new software.

>>Any enlightenment on the issue would be appreciated.

Using your example - it's more like refusing to talk to someone who is, in your opinion, has a foul mouth on the repeater. THERE IS NO LAW THAT SAYS YOU MUST RESPOND TO EACH CALLER ON THE REPEATER IS THERE?

Sorry - you can not manufacture any legal wrongdoing here whatsoever. It does go against the spirit of ham radio though - but it is simply their choice.

5864. Ultrapack and Win95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-24 00:00:00 UTC
From: Frank G3YCC <frank@yorks.demon.co.uk>
Message-ID: <0bq60CA7gW3wEwmj@yorks.demon.co.uk>
Source record: 39653

Hi and thanks for reading this. I am having problems with Ultrapck and
Win 95 graphics. My TNC is a Tiny 2 and instead of getting lines of
graphics, I get lines of MMMMMMMMMMMs etc. I am told it is to do with 7
bit or 8 bit conv, but so far am unable to cure it. Can you help?
Thanks

5865. connecting modems to radio receivers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-24 00:00:00 UTC
From: romanr@bga.com
Message-ID: <4bih6g$lo6@giga.bga.com>
Source record: 39740
Cross-posted to: comp.dcom.modems,rec.radio.amateur.digital.misc

Don't laugh. I'm trying to connect my
modem to a 2-M ham radio receiver so that
I can listen to packet at 1200 baud. Can
anyone offer me suggestions on how easy/difficult
this should be? What signal levels are required
and is a DC level required or can I send the
receiver output directly to the modem's tip/ring?

Any help would be appreciated.

As opposed to hooking the modem up to the radio, then listening to the tones at the other end (I assume with a TNC), hook the (external) modem directly to the RS-232 port on the TNC via a null modem. I have a US Robotics 14400 hooked up in this faishon, and all I have to do is call home from anywhere...and Im on packet from my home station. Works great, and beats cary around a packet station with my laptop (which has a built in modem :)). Also can take full advantage of my high power, high profile home station. I have also installed an A/B switch, so I can easily switch from my computers serial port, to the modem.

Hope this helps, let me know if you need further info.

Happy holidays, & 73.

Chris, N8WCT

5869. JVFAX VIS code ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-25 00:00:00 UTC
From: jlbarber@wolfenet.com
Message-ID: <4blavp$qdg@news1.wolfe.net>
Source record: 39656

Hi folks !

In the course of working on my SSTV program, I've run across a bit of a snag in that it appears, at least, that JVFAX does not use a "standard" VIS code for its SSTV modes.

As I would like to make the program compatible with all the popular programs out there, has someone detailed what JVFAX uses, or perhaps an email address for the author ?

Thanks,
Jim Barber, N7CXI

If the modem you have is a "Bell 212-A" type modem (standard 1200 bps)
then it's not going to work, it's the wrong type.

>I'm trying to get my JNOS configuration to initiate a PPP connection
>with my local ISP. How do I do this?
>I've attached the modem port and can get the modem to dial out using
>the comm command. Can I specify a script file to automatically login?
>The purpose is obviously, to send mail via my NOS box to the internet.

I'm doing that right now. I was wondering if your version of JNOS had the dialer commands compiled in. This makes it easy for autodialing. :)
I dial in maunually with mine so if you still need the proceedure drop me a line on E-mail.

No, but you can cut noise level down by shielding it. Take a look at the
"key" part of your keyboard. It's one big antenna. My keyboard has a
microcontroller with a 5 MHz crystal, and it gave big signals every 5 MHz.
You could pick it up S9+ at 145 MHz on an HT across the room. Note that
packet stuff is around this frequency.

I disassembled the keyboard, applied adhesive aluminum tape under the keys,
made an envelope for the microcontroller board out of hobby copper, and
added bypass caps and ferrite beads. It took a while, but worked.

5886. Please Help: KPC-3 to Alinco DJ-160

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-26 00:00:00 UTC
From: cavett@mindspring.com
Message-ID: <cavett-2612952024440001@cavett.mindspring.com>
Source record: 39673

Greetings. I am new to packet radio (my KPC-3 just came out of the box), and I have a small problem. I need help building a cable to connect a Kantronics KPC-3 to an Alinco DJ-160 HT. The KPC-3 terminates in a female DB-9 connector. The DJ-160 has a separate two conductor speaker jack and a three conductor mic jack. I am most concerned with how to deal with the mic input on the DJ-160, as I have no schematic for the radio. Can anyone provide specific instructions on how to build this cable? I am prepared to provide a capacitor to isolate the DC on the mic and a resistor for PTT, I just need a specific wiring diagram. Your help, in the spirit of the Amateur Radio community, is greatly appreciated.

Sincerely,

Cavett Binion, KC5ABM

Hello there,

DxNet v1.37 wich is a DxCluster program compitable with PacketCluster (TM
of Pavillon Software) is available on anonymous'FTP ham.ireste.fr.

English doc for 1.37 is not ready yes but you can get the 1.19 doc and
the UPDATE file to begin.

Best 73s and happy new year.

AT&T is busy installing PCS equipment licensed for band A 2GHZ and Narrow band 940Mhz at a public facility I work at. Review of their specifications show a singular T1 driving the installation. Range on a line-of-sight installation in open terrain with antenna HAAT around 100', the effective coverage zone is 1 mile. Getting into 2 miles puts you deep into the roll-off zone. The facility has several buildings with several floors and configurations. Due to presence of public, ERP is being limited to around 150W. (About 6-10 Watts at the Amp)
[Look Ma, This plastic dome is a magic sun lamp]

I dont think we'll be seeing ethernet data rates on any publicly offered PCS net with these kind of specs I'm reading through. I think their target market isnt the heavy video conferencing crowd they play it up to be. Most lines will service digital cellular telephony.

Cheers

Try the newer rigs, for example the Kenwoods, which have a suitable
socket on the back. Ask your local ham shop for details of which are
fitted with such. I think most rigs are suitable equiped now, apart from
handies.
Happy new year.

Hi, Ned

KaWin should work on COM 1. And from your description, I can't understand what went wrong with your TNC or other packet program. Actually, NOTHING should have happened to your TNC. Do you remember what speed your TNC was set to use to talk to your computer? Make sure your old program is set to that speed. If that doesn't work, set an autobaud routine with the TNC and program to get back in sync.

The KaWin author is Stan Huntting, and he's quite responsive to E-mail. His address is stan@mutadv.com

good luck and 73

Use the diagram for the Icom 2AT style radio in the KPC-3 manual - it
works for the Alinco HT. You might also want to check out our web site
with many wiring diagrams:

```

You need an old bell 202 type modem, because thats what the guys at TAPPer (?) had when they estabilished the "standard". 202 was the (a) standatd before 212's came out in the early 80's as I remember. There were 202S's and 202T's one was dial-up and the other for leased lines. (I'm not sure but I think "T" 's were leased line modems) The last time I was in one of our local Banking computer service provider there were still racks and racks of leased line 202 modems. My memory is fading but I seem to remember dial-ups were 1200 baud and leased line were 1800 baud. when we put in a lot of the first ATM's and lottery circuts they were 202T's. And still could be.....

>Why not just spend $125 for a Kantronics KPC-3 and do the job right?

To which I reply:
Why not spend $7.95 for a TCM3105 chip and $1.95 for the crystal for it
and do the job right? Too stupid to build your own?

In answer to Roman's question:
You will probably have to set the 202 modem up for leased-line
'dry-circuit' use to force it NOT to look for any holding or sealing
currents. You will also probably have to set it for short carrier
detect time, even though most hams run far too long a TXD. Impedence
matching should not be a problem as long as the receiver you are using
has sufficient output level to achieve the levels needed by the modem -
typically -10 dBm. Most of those modems were designed to exhibit 600
to 900 ohm impedence and that will bridge a loudspeaker output.

Keep in mind that the store-bought-packet-box boys are running
synchronous HDLC (even though they mostly don't know it) so you'll need
to do some cleverness at the USART level - a standard PC-style serial
port won't work.

Best of luck!

5899. Is there a non-ham packet radio?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-27 00:00:00 UTC
From: ericc@az.com
Message-ID: <4br640$hq1@news.netusa.net>
Source record: 39681

Is there a non-ham variation of packet radio available that people can use without paying fees to use? I want to be able to avoid the restrictions on speech imposed upon ham bands, etc. Another question is for my father, the commercial fisherman, who needs a net connection out (literally) in the middle of the pacific to download IR imagery. The only things I have found are prohibitively expensive..

Any ideas appreciated - Thanks!

5900. 2-meter rig suggestions

>KEN
>
I hate to throw water on your fire, but the 1278 is almost useless for
fax/sstv. Check out JVFAX 7.0. for a few bucks you can build a much
better fax/sstv unit. The rx uses a simple uA741 driving a comm port.
The tx uses a couple of resistors and a cap. This setup simply blows
the MFJ out of the wqater. I have a 1278 that I use for RTTY/AMTOR/
and ASCII(real common). The MFJ just does not have the resolution to be
usefull. While I think the 1278B supports "grey scale" it will still
not do that good a job.
I have never seen any software(other than MFJ "mutlicom"?[it has been
a few years since I have used it] that will operate in fax mode.
Good luck what ever route you go\
jvfax is at the arrl and amsat ftp site. It might be at the oakland ftp
site as well.
Hamcom30 is another good program, but I prefer jvfax 7.0.

<102670.1206@CompuServe.COM> says:
>
>I just purchased an MFJ-1270C TNC. It has HF weather FAX
>capability, but the user manual says virtually nothing about how
>to use this feature. Does anybody know how to command the unit
>for WEFAX reception and the tuning offset to use with my HF
>receiver?
>
>73s
>
>Brian Webb, KD6NRP
If the MFJ1270c is anything like the MFJ1278, the wefax reception is
pathetic. Black and white with NO resolution. Check out you
disk that came with the tnc. In the 1278 the command is something
like mode fax NNNN where NNN is the type of fax. I don't have my manual
here(at work)but I will look up the exact command and what program
I had to use.

A much better approach is to download JVFAX 7.0 from either the ARRL,
Amsat, of(I think) the oakland ftp sites. It is near freeware, Works
GREAT and uses a simple uA741 powered by, and "talking" to a Asynch/comm
port. Costs less than $5.oo us if you buy everything new. It is really
the best way to go. Hamcom is another good(though not as gooda as JVFAX
in my opinion). If you have a "real" or 100% compatable Sound blaster,
you could try WXMAN2. It does a good job just by feeding the sb card
with audio.
8080KHz is the best place to start. Nam is on every night as of a couple
of weeks ago. I guess they will keep on the air even if the Feds can't
get their budget togather.
None of the above programs can receive NOAA wx sat fax with out some work.
JVFAX has a diagram for a WX sat am to fm fax converter. It uses an exar
2201?(check out the diagram), and while it is best to build a "real" am
fax demod, you can get impressive results by feeding the output of the
exar to any of the above programs.
Good luck
Email me if you have any questions, I won't be back on unitl jan 2, 1996.
(unless I end up in here for something else)
WEFAX is great fun, do not get discouraged by any intitial hassels. Hang
in there. It will be worth it.

Well - I guess this is one area where the US regs drive commercial development across NA. Not sure about south of the border but here in Canada we can transmitt binary files on all bands as long as the basic rules are followed (bandwidth and ID rules followed and as long as the data can be readily identified/run - ie not encrypted). In the US, I believe you can not do the same on many of the HF bands.

As a result - even though Pactor can transmit 8 bit data -

I have yet to find a programme that will permit one to do so . This includes DSPgold, PKgold etc.

Amtor is not an 8 bit protocol - so it would not work with that one.

Sure wish someone would do a programme that could be distributed outside of the US :-) that could do as you suggest!

Season's Greatings!

Pactor and G-TOR both have the ability to do binary file transfers on HF, and there aren't any regulatory reasons prohibiting such transfers in the U.S. One software package that I'm aware of is working on such transfers, and will probably be announcing it within a few weeks. I can't at this time say which package, but I'll be sure to post it when I can.

Thanks David-

I've heard that the US regs doesn't allow Binary, but certainly haven't confirmed that - it sounds strange to me why they
wouldn't, as there's already binary-type data that's not protocol related out there now - at least in the AX.25 HF packet
world.

Anyway, my application was commercial in nature.

Thanks!

Mark

I seem to recall seeing on either the philips or the magnavox home page
some mention of a single-chip amfm car radio. I've also heard mentioned
a motorola chip that is a single-chip baby monitor.

I'm not sure, but I would imagine that most of the newer cellular phones
are just a very few chips -- especially the so-called PHS/PCS models.

I saw a posting on here the other day on converting a 2 channel Motorola Maxtrac(VHF High Band) to a 16 channel. I have access to both the software and hardware I need some technical advice on how to do it. I have
4 mobiles and 1 base station I use for my construction company and would like to convert them to 16 channel radios. I priced out new radios from a local guy and he wants $425 a pop for 16 channel ones(used, no less) and I spoke to a friend who says the hardware is only about $25 for each radio so I
figured this was the way to go. I really could use some help from you guys.
I'm really not a radio-guy, I'm a scanner-guy myself. Any help would be greatly appreciated. Thanx in advance.

Actually, it is quite possible to do binary file transfers in KaGOLD
(and PkGOLD) and has been for quite some time.

5917. Use of PGP On Packet (and other modes?)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-28 00:00:00 UTC
From: gayle@ldd.net
Message-ID: <4bth48$m1e@sparky.midwest.net>
Source record: 39604

Hello, Folks:

Looking for comments about how people feel about the of PGP Signatures on Packet and/or other digital modes.

Before you reply, please read on....

What I am talking about here is the use of PGP Signed Clear Text messages. That is, the text of the message is readable by anyone who looks at it. The PGP Signature simply allows people to confirm: (1) That you _really_ sent the message, and (2) That the message content has not been changed since you sent it.

After discussions with several communications lawyers, I can see that this in no way violates the Part 97 restriction on 'codes and cyphers' since the intent is not to obscure the meaning of the message.

What this does is a sort of double edged sword: No one could pretend to be you and send a message that the FCC might take exception to, but at the same time, you would have a VERY hard time getting out of hot water if you really did send such a message!

Anyway, I would appreciate your thoughts.

5918. APRS & DeLorme Street Atlas 3.0?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-28 00:00:00 UTC
From: Arthur Booten <N2ZRC@gnn.com>
Message-ID: <4bu9p4$ktv@news-e1a.megaweb.com>
Source record: 39605

Hi,

In perusing the various screens in APRS 7.4f, I noticed on the "Validation and User Registration" screen a list of options for the program. Among them is "$34 Optional Ham Interface to STREETS-ON-DISK and DeLorme, etc." As I currently own and am very impressed with DeLorme Mapping Co. Street Atlas USA version 3.0 (and 2.0 before that,) this made me very curious.

After scouring the copious documentation provided with APRS, the only references to ANY C-D's are those produced by The United States Geological Survey. These files describe how to make maps from the USGS discs. There is NO MENTION that I can find anywhere in the APRS docs of these other products.

It was my first impression that the DeLorme disc could be used directly, with APRS superimposing its data on the C-D maps, but that can't be ... the map's a Windows-based product. Then I figured Mr. Bruninga made the option available so we could, as with the USGS C-D's, MAKE maps for use with APRS. Or maybe I'm wrong on both counts and it's something else entirely!

If you have any experience with APRS & either the STREETS-ON-DISK or DeLorme Street Atlas USA products, please E-mail or packet a response back to me at the address below. Thanks & 73

5919. ULTRAPACK and WA8DED???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-28 00:00:00 UTC
From: herksen@ibm.net
Message-ID: <4bu996$11be@news-s01.ny.us.ibm.net>
Source record: 39606

Hi there and thanks for reading my message.

I noticed a meesage in my local packet BBS. that a new version of ULTRAPAK was
released.
Well, I downloaded it from a FTP site, and tried it out. It's GREAT stuff,
but it doesn't work with my modem as use a WA8DED eprom in it.

I wrote a message to the author of the program:

> I have dowloaded your ULTRAPAK program from the internet.
> What a GREAT program, compliments for this great archievement.
>
> I am using it but I have only one problem:
>
> It seems that it doesn't support the WA8DED eprom in my TNC-2.
>
> Is there any way of making it talk to a TNC fitted with a WA8DED eprom??

Thanks for your comments! I don't have much knowledge of the WA8DED
interface, but I think it's a host mode type of thing isn't it? Unfortunately,
UltraPak is purely a terminal mode program and hence I think it's going to
be impossible to marry the two together.
I'm sorry that this is a negative response, but I can't see a way around it.
I believe the DED software requires the TNC to be polled for data doesn't
it, and of course UltraPak doesn't support this protocol.
I hope this at least helps.

>
> Any related information/software would be appreciated.

In the comp.dsp group someone asked about the DSP core used in
an ASIC on the SB 16 ASP a few days ago.

It is apparently an SGS-Thomson ST19850 DSP (the D950 core). Accessing
it with one's own software probably requires getting the info from
Creative, which could be difficult. You might find things easier with
one of the PSA sound cards, which have a user-programmable DSP, and PD
development tools.

Wow! Is this ever a gem! If all new TNC users would check out this web page before warming up the soldering iron there would be far fewer unused TNCs gathering dust in the shacks of frustrated hams. And Gloria has published a marvelous book that reveals all the mysteries of TNCs. A must-read for anyone who wants to go beyond "appliance operating" with digital radio.

The WA8DED firmware (as well as TheFirmware, which has several
enhancements) can operate without using the host mode, but the
commands are quite different than those used by other TNC firmware.
It might be possible, however, depending on how Tim has implimented
UltraPak.

If you really want to use UltraPak, why not just change to a standard
TAPR firmware eprom? It is even possible to have both with bank
switching (there is a TNC made in Germany which does this).

Well Lynn, according to private email I had with Jeff (WA4EGT), binary is not possible using
PACTOR or GTOR. I know that your software features re-startable binary file transfers in the
packet (AX.25) mode, but what about a more robust, "adaptive" protocol like PACTOR/GTOR?

When you answered the above question, were you possibly thinking of packet only?

Mark

Well it's good to see a supporter of PGP. I have implemented Roger
Barkers WIN PGP server for winpack. It has a couple of BUGS in it but
other wise works great.

I use it without exception. We had a WHOLE spate of people pirating
callsigns, sending some rather nasty messages. I started the ball
rolling by installing PGP and preaching to the masses, how wonderful
PGP is. Unfortunatley the SLACK AMATEURS don't give a stuff about it
one bit. They whinge and bitch that their callsigns are being pirated
but they won't implement a "practical sollution"". The messages are
still in clear text (no ascii armour) and it just has a sig on the
bottom.

Rogers server checks both incomming private messages and bulls. It
works ABSOLUTELY seamlessley with winpack and makes the whole thing
worthwhile !!

I get STUPID questions from people "Will it run on my C64/128 or how do I use it on my dumb terminal". Basically it won't TOUGH !!!! RTFM !!!! It all gets too hard and they give up, oh "sigh".....

Anyway, I think it is absolutely GREAT and wouldn't send out an unsigned message, NO WAY !. Have a look at winpack and the PGP server, it's great !!

Cya
Cheers..Peter

Hi
Although most modern modems won't be able to do the Bell 202,
It is possible to use one of the soft loadable DSP modems,
made by cardinal or digicom. These modems are available from
many for quite cheap because they can't be soft upgraded to
28.8K v.34. The modems are quite simple hardware wise and
I have determined how to use them to run your own personal
DSP code. The Bell 202 protocal is quite simple and should be
easy to write some code for. One needs to learn a little of
what DSP is and how to write code for these. Anyhow, if
anyone is interested in usnig one of the above modems for
things like packet modems, I'd be glade to pass on what I
know. They DSP modems make good DSP experimenters boards.
Dwight

PS: There is a group of hams that have done similar things
with a sound board called a PSA board. You might contact
Johan Forrer <FORRERJ@frl.orst.edu> about information in
the hfsig@tapr.org group.

Several of us (N0ARY, N5ASD, EA3CI) are using the internet as a
forwarding wormhole between BBSs.

The method used is the old "Import/Export" file format that was introduced
by the W0RLI BBS. It consists of concatenating packet mail messages, beginning
with "SP CALL@SOMEBBS... and ending with "/EX" for each message, and making
a single file from them, which is then mailed to a special internet address
at the other BBS, where they are fed into the local BBS for injection
in the RF packet network locally. There is a compression scheme available
also, designed by KB2EAR.

This is very easily done for anyone running one of the Unix operating
systems, but can be done with DOS, with somewhat more pain.

If any BBS sysops are interested in joining our little "network", please
write me at "durham@w2xo.pgh.pa.us" on the 'net, or W2XO@W2XO.#SWPA.PA.USA.NOAM
on packet. I am particularly looking for an East Coast station , a Mid-West
station, a Southeast station and a Northwest station.

Thanks and 73
-Jim, W2XO

5934. High speed packet for users in Los Angles (Cyperess, Irvine)?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-29 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseDKBx6x.G6o@netcom.com>
Source record: 39621

I'll be moving to the Los Angeles, CA area (cyperess, Irvine, Anaheim Hills)
and was wondering if any BBSs exist (or nodes/ gateways/somesuch to a BBS)
that can do something faster than 1200 baud (9600, or faster). 1200
seems awful slow compared to a 28.8Kbaud modem connected to my ISP.
What TNC and radio (what freqs?) are good for this?

TIA

it's the easiest way to just get a packet modem. depending on the
intelligence, it will cost approx $20 for a no-intelligence-at-all modem to
several hundred $ for better ones that are stand alone. The el-cheapo modems
only will translate the input signals to 0's and 1's.

try to take a look at , what is it, rec.hams.radio.packet or something.

PkGOLD and KaGOLD allow multiple callsigns. Many users have
Amateur calls, MARS calls, CAP, etc., and family members with
different callsigns.

Also, PkGOLD and KaGOLD have a simple system for changing many
of the ID parameters as a group, to change MYCALL, MYMAIL (MYPBBS),
node callsigns, etc.

All that is required is to ask about additional callsigns, either
before, during, or after purchasing, by phone, e-mail, etc.

Source record: 39624

Limiting the requirements to Winapp interface programs reduces the array of features avaiable, and the options available for different kinds of computers (notably less powerful computers).

DOS apps work fine in Windows, even better in Windows 95 and Windows NT. They can run in the foreground, background, and in the case of PkGOLD and KaGOLD, provide a lot of features that are not in "true Winapps" including background file transfer, conference mode, dual port operation, multi-mode, huge scrollback, remote commands, and more.

Also, a well-written DOS app gives you the flexibility of running in Windows, or on a less powerful Laptop, and all sorts of features.

Lots of users run PkGOLD and/or KaGOLD in Windows, and they've tried the Winapps out there and return to PkGOLD or KaGOLD -- because of the features.

I like Windows, use it a lot, and Windows 95 is a great improvement over Windows 3.xx. Some of our users run Windows NT or OS/2 and tell us these environments are also excellent multitaskers.

Windows apps, per se, don't multitask. They all share the Windows time slice, as all apps are called from the larger application called Windows. DOS apps are given their own time slice, and don't have to deal with the enormous quantity of windows "events" or "messages" that tend to slow things down.

Just some thoughts for consideration.

Mark,

We have done numerous Binary file transfers, I think your question on e-mail implied unattended transfers. At present, in the TOR modes, we support a binary transfer (raw send, raw capture) but not a protocol per se. So both comments are accurate.

Want to send a binary file? If both operators are present, it's easy. Given the need for attended stations on HF, at least stateside, one might conclude that ARQ binary file transfers are supported (since the operators are there to start the send and capture).

5942. MFJ-1278B Kiss mode - HELP!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-29 00:00:00 UTC
From: Kjell-Viggo Loevhaug <kjellvl@ksnet.ksedb.no>
Message-ID: <4c0lkq$137@nms.telepost.no>
Source record: 39629

Hello!
I'm using a MFJ-1278B in KISS-mode with BPQ 4.08.
I have problems with very long pauses before the TNC starts to send packets - it is reluctant to send.
Further investigation indicates that the PERSIST-parameter must be set at a low level.
The PERSIST parameter should be possible to set by means of command 2 in kiss-mode. I have tried this by sending FEND 0x02 0xFF FEND to the TNC, but it seems like it sends the data on the air instead of interpreting it as a command. FEND 0x01 0xFF FEND works well (setting TXDELAY to 255).
Any ideas of what this could be ?
It drives me mad !

>Anyway, I think it is absolutely GREAT and wouldn't send out an
>unsigned message, NO WAY !. Have a look at winpack and the PGP
>server, it's great !!

I have not messed with TPK much... Looks like I may have to dig a
little deeper there. Sounds interesting.

On the FBB servers, I would also like to do one that will let users
sign a message while online. This would, of course, require that the
BBS be password protected and that the user's Key be on file at the
BBS. This is probably not a real good way to go due to the many
possible security leaks.

The TPK system at the user's QTH sounds like a better way to do this.

You need a Terminal Node Controller (TNC) for both these modes and
suitable software, cables to connect TNC to radio and also to your PC.
> And I wish to know if I can
>use HF for RTTY or Packet.
Yes HF is OK for data modes, but not all TNC operate suitably for packet
on HF, but are OK for VHF/UHF. There are multimode TNCs that will do
all, or most data modes on HF and higher freq's

The IC720a needs a few mods in order to work on amtor.

The following is from the ICOM newsletter 35 of June 83, article by Roy Philpott DJ0OW, G3VCH.

Quote: All mods are to the main board, easily accessible on the top of the set. The modification consists of replacing C42 and C43 with 1uF. Also replacing C40 (1uF) with 0.47uF. This effectivly shortens the T-R switching, also it is necessary to remove the AF amp mute by placing a shorting link across C69 (there will be audio present on normal operation, but it doesn't cause a problem).

I did this mod when I had an IC720a and it worked fine with an AMT-1 terminal on "SSB" mode.

Bill Storer, VK2EG, telephoned Angelo, W5KSI, today Friday
29 December that Sid E. Molen, VK2SG succumbed to a heart attack
Friday morning Australian time. Sid was 76 years old and had
been in poor health since 1993.

Sid, along with Bill, VK2EG, was a co-founder of the Australian
National Amateur Radio Teleprinter Society (ANARTS) in the early
1970's. They subsequently started the weekly RTTY DX Notes, which
were renamed the VK2SG RTTY DX Notes, in 1993, when Sid had to
relinquish his contributing efforts to others.

Sid's by-line on the DX Notes was 'DX1', a sobriquet he earned
by having received the first RTTY DXCC in Australia.

An autobiographical sketch of Sid was the featured cover story
of the RTTY JOURNAL of March 1989. A subsequent follow-up
appeared in the DX NEWS column of the RTTY DIGITAL JOURNAL
of September 1993.

The VK2SG RTTY DX Notes will continue to be generated by
the present group of rotating editors, I5FLN, WB2CJL and W2JGR.

Sid Molen will be sorely missed. Rest in Peace old Buddy.

From his friend and colleague Jules W2JGR

I made this mod and found it beneficial, especially for AMTOR when the band is crowded it's a big help. Only thing is you have to play with the passband control quite a bit to find the optimum setting, which is no longer in the center. This is a little annoying if you frequently switch between digital and voice modes. Also the instructions that I had for this mod seemed to be for a slightly different model than mine and I had to dig into the schematic quite a bit to locate the components and connection points.

You can compile a kernel with ax.25 support included and use the ax25-utils package. You have to run the TNC in KISS mode. The 1.3.x kernels come with ax.25, although some work and some don't (Hey, that's why they're called beta!) Try sunsite.unc.edu.

Several of the LA area BBSs have inputs on 439.025 @ 9600 baud. I have
been running a 2meter 145.65/UHF 439.025 node in Mission Viejo for a
couple years. I am using a Kantronics Data Engine and the Kantronics
D4-10 Transceiver on the node. My node's alias is COAST. Check the
node list for available BBSs.

Hello all..

I am looking for the AX25-UTILS for Kernel 1.3.46 Linux.

Do you know where can I found it ?

Someone told me that these utils are in sunsite.unc.edu on /incoming
directory but this directory does not exists !!!

Hello Jeff... I have a KAM v 7.1E and I tried a lot of soft for this TNC
and the best software I have see for this TNC is the XPKAM,
multi-windows, multi-ports simultaneously, GTOR monitoring included,
works with CD callbooks and mouse, auto CQ..etc.. The only thing this
soft does not support is the YAPP transfert protocol...

The KAGOLD I try it a long time ago (2 years?).. Perhaps at this momment
it is the best KAM controler ??..

5970. For Sale: MFJ-1270B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-30 00:00:00 UTC
From: dolsonj@ix.netcom.com
Message-ID: <4c49qp$73b@ixnews5.ix.netcom.com>
Source record: 39559

For sale, in excellent condition, one MFJ-1270B VHF/HF packet TNC.

Original box & packing materials
manual
32KB RAM
version 1.2.9 firmware
HF/VHF selectable
1200/300 baud (upgradable to 9600)
Power adapter
Two radio interface cables: one generic (you add connector) and one for
Yaseu VHF rigs (if that's what you've got).

Asking $75 (I'll pay shipping).

Works great. Why selling? Too many hobbies. Got to cut back
somewhere.

If you aren't too interested in packet specific "bells and whistles" You
can probably use the program minicom. It is similar to procomm and
telex, but will do file captures and allow you to scroll back, etc.

Well Jeff I dont agree that its easy with Kagold/Pkgold. I remember
trying this with a local friend and, if my failing memory serves me
right, we had to turn off various parameters in the KAM...such as
carriage returns. There were others but can't think of them at the
moment. What I would call 'easy' is the way that PC-Pakratt does it. I
would hardly call the KAGOLD method as being user-friendly but despite
that I STILL think its the best software around.

Howdy,

The wormhole that we, the Clear Lake ARC, are running has been
connecting to a Moscow Convers node for the past few months.
Unfortunately we have been having the worst of time lately connecting
to Moscow. What I am looking for is another converse node
(preferrably here in the states) that we could connect to.

If you are willing to allow us to connect to your node please drop me
a line.

Thanks!
73,
Rod

Jeff,

The rules were ammended this year. It is now permissible to have an operator at only one end (and automated operation at the other end) on any HF frequency, and in specified subbands, both ends can be unattended. Given this, it'd be nice to have more of a protocol in xxGold to support such transfers.

Gerald,

I'm quite puzzled by your comments.

Unless someone has extensively modified the TNC files, sending a binary
file transfer is simply a matter of choosing "raw send" on the transmit
side, and "raw receive" on the receive side.

There are a few minor issues, but those are easily handled.

Of course, if you aren't using the "raw" selections, then you probably
will have to fiddle with alot of parameters.

Jeff, I got my copy of KAGold while we were in Indiana for Christmas.
I got it loaded with NO problems.
Now I am trying to learn it,the KAMPlus an AMTOR/RTTY procetures.
I think I am near brain Overload.

The KAGold is simple enough its the Army procedures that are
killing me :-)

One quick whine and snivel..... make the Capture msg to file, and
send
file simpler for us simple folks please.

I am using KA-Gold and it seems to do all that it should.
Its not anymore hard to learn than anyother new software.
I do believe there are improvements that can be made but
nothing is perfect.

Hello.

I have a KamPlus, vhf and hf radios, a 486DX2 computer with 16MB of RAM, and

a ULTIMITER II - Wheather Station with the PC Data Logger (softwere & cable).

The Ultimiter is working properly with the Pc Data Logger and it's cable

connected to the RS232 COM2.

My question is, how does the Ultimiter II makes the "Automatic Packet

Reporting System"? Where is connected the cable from the Ultimiter II, and

what commands must I give to the Kam?

Please,if you can help me, send a packet msg to the adress:

CU1BI@CU1ARM.CUAZ.PRT.EU

THANKS IN ADVANCE!!

Does anyone have a in good shape Motorola Flip Or Brick portable Dignitary Cell Phone for sale thats not in service? Also does anyone know of any magazines and/or books that explain how Cell Phones and Pagers work from the simple stuff all the way to the technical like how they operate and what all is used in transmissions and everything basically, as you can tell I don't know a whole lot about how they work!?????<Grin> Also does anyone want to buy a Cell Phone prgrammer, for more info e-mail me back. Thanks..... Rob......

5993. RS HTX 202 on packet??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-12-31 00:00:00 UTC
From: Mark.Hinkleman@bbs.c4systm.com
Message-ID: <1995Dec31.002316.329@c4systm.com>
Source record: 39580

IThere is new ham in the area that is trying to use the Radio Shack
HTX 202 with a baypac tnc to get on packet. The set does not seem to
work with the htx 202. The system works fine with other HT,s. There
seems to be a problem with the audio that goes from the htx 202 to the
baypac tnc. The baypac has a problem decoding the audio from the Radio
Shack HT but not other hts we have tried.
Has anybody had a similar problem????
If so, I would apperciate any help and advice as to how to solve this
problem.
Tnx in advance... Mark... NU8Z
